What is this "must have high power and replaceable antenna" to be useful. Until I got my UV-5R, my go to radio for the last decade or so was an Icom IC-Q7a. I've only used it with the stock antenna and its only power setting is .3 watts. It definitely isn't a toy and it still works great.

And every channel of my UV-5R is set to low power. I only toggle to high power when I have to (which is basically never).

Hi John,

OK, let me see if I get it correct.

- GMRS (General Mobile Radio Services): dates from the 1940s, licensed in the US, license-free in Canada, 23 channels in UHF @ 25 Khz (including all FRS channels), up to 5 Watt, allows handheld, fixed or mobile stations, allows use of repeaters, detachable antenna's allowed

(UHF frequencies already in 1940s?)

- CB (Citizen Band): dates from 1970s, unlicensed, 40 channels around 27 Mhz. Handheld, mobile and fixed stations, detachable antenna's allowed (gain antenna's ???), repeaters not allowed, FM, AM or SSB, "Welcome to the jungle".

- FRS (family radio service): dates from 1996, very low range, license-free, 14 channels in UHF @ 12.5 Khz, 500 mW, handheld radios, may not use repeaters, only fixed and non-detachable antenna, FM-only.

Equivalent to PMR446 here in Europe. (althou there does not seams to be a equivalent to the DPMR service at 446.1 to 446.2 Mhz here in Europe)

Looks to be interesting for personal use and low-distance communication. (hence the name "family" :-)) or the poor-man's business service.

- MURS (Multi-Use Radio Services): dates from 2002. 5 channels in VHF range @ 11.25 or 20 Khz (old "business radio" channels), voice or data, voice repeaters or data store-and-forward not allowed, up to 2 Watt, unlicensed, detachable-antenna's allowed (does this include high-gain antenna's?)

Looks like an extension of the FRS services for data; but it seams to be used for all kind of devices, but all devices to use this service has to be certified by the FCC.

If this is correct, it looks like the UV5R is not allowed on the FRS (detachable antenna, to much power) and GMRS or MURS (not certified by the FCC); so only ham-radio or business radio.

Feel free to correct me if I am wrong.

Most, if not all, of the bubble pack GMRS/FRS radios advertising 20, 30 or more miles say in very small print "up to". So a radio a radio that barely transmits a half block legally falls within the "up to" range. No false advertising, not their fault you didn't read the fine print.

We don't see FRS radios "advbertising "20 miles" range". It is the dual service (FRS/GMRS) radios that operate using 4 watts or more as GMRS radios on GMRS frequencies that claim "20 miles".

I have the Diamond X50AN. It works great as a base antenna. The thing to look at is the antenna radiation pattern on 2m and 70cm. They will be different for the two antennas. The X50 will typically have a flatter pattern (higher gain) and lower take-off angle than the J-pole. Pick the one that best meets your needs.

That said, I really cannot use gain antennas at my QTH with the UV5R because of its selectivity problem.

Amazing that when you ask a question like "what is the meaning of the rule" or "Why is it in place" so that you can understand it better, that there are people who really think "because it is the law" is a good answer. I never said I was going to try to rule the word by dominating all radio frequencies... For the record, I also did not say I was going to use my UV-5ra to break the law.

Thanks for those who gave answers about frequency gain and some who talked about short range and keeping communication open, and making it so a just few frequencies can carry most of the country.

Some people here need to lighten up. When your kids asks why is the sky blue, do you answer with BECASUE IT IS...

I am now going to go run with scissors, yell fire in a movie theatre, drive too fast, and use my UV5 to broadcast on every frequency I can...

I work with a CERT team in Los Angeles County and we use FRS for individual teams. One of the requirements is that all CERT members have to be able to communicate within a team by radio regardless of how they are licensed. If you had a bunch of teams all using our simplex 2 meter frequency it would easily get overloaded.

you really need to fix your f'ont size kristoff, UGH!

To answer your question, The baofeng radios are so widely used that The FCC doesn't have the time, manpower, or resources(MONEY) to go after every person who uses the GMRS Freqs or the MURS freqs.

Hell, To save money, one local wal-mart here uses nothing but Uv5R's on MURS freqs.

There is a lot of misconception floating around about the MURS and GMRS Usage. First, The FCC doesn't have a rule or a part designating a murs specific radio like most of the idiots in here claim. The Murs radio was a "concept" dreamed up by some radio company.

MURS/FRS/GMRS are all part of the black dot, red dot, blue dot, JOBCOM freqs that were used YEARS ago before FRS really came into existance.

HELL, i use to use the old 49.845 mhz radios for biking use.

35739. Memory Programming problem

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-24 01:17:18 UTC
From: <bevin.alexander@...>
Topic: 35739 Message: 35739

I am new to the group, but been using UV5-Rx for some time. Ham, call sign K4ALE.

I recently ordered a new [3d] HT, in yellow, model UV-5R+Plus. I have always had trouble programming from computers, and have tried an XP, Vista, and new Windows 8 computers with equal trouble. I have, however, gotten comfortable with programming memory channels by hand.

However, when I received this new HT, I could not get it to save the offset requiried for repeater function. Everything else saved. It has software version BFS-311. I tried everything, including two different cables and both softwares. It loaded one memory before the software ceased communicating with the radio--and that worked fine. Still no hand programming.

I called the vendor, who very graciously sent me another one. Exact same problem. Everything else works, and programming a repeated in frequency mode is fine.

There is a slight difference I have noticed in the manual procedure: it stores "transmitting frequency" regardless whether I press "*Scan" to reverse after saving the "receiving frequency." That press does nothing.

There must be another way. I have found a reference on line to a "bug" along these lines, but getting two with the same bug is unlikely [not impossible].

Has anyone discovered the magic sequence to load memories manually?

I love these little HTs and would like to solve this problem. Many thanks in advance.

Bevin

Information is good: http://www.jetstream-usa.com/jtb3.pdf

On 10/23/2013 11:35 AM, toshutrinity@... wrote:

A number of users here, have suggested the Arrow antenna J-Pole antennas for use at home, with the UV5RAt home, I had a local ham suggest getting a vertical such as a Diamond X50 or a comparable Jetstream>

http://www.gigaparts.com/Product-Lines/VHF-UHF-Dual-Band-Antennas/Jetstream-JTB3.html

The price is about the same, but the gain a bit higher for the Vertical. I am wondering ojn what basis would you make the decision to buy one over the other??? In my case, I am planning on using the antenna iniatially with the 5R, but I assume that ultimately I might also buy a mobile or full range transceiver for home....but nothing is certain. ...

No ideas about this ?

Please any thing.

---In baofeng_uv5r@yahoogroups.com, <paneuro500@...> wrote:

Hello. I explain.

I have a uv3r and uv5rb.

I put my uv3r in my car with an antena 5/8 for vhf and only with 2w I hint a lot of repeaters in my zone.
I put my uv5rb and only hit one repeater.
I think thats it´s brokem or it has any defecte in the circuit or any component are badly solded.
The configuration of the radio, tone, ste, etc its ok and in the same way that the uv3r.

I dont know if send to China or buy another new.

I read the forum but dont find one response certly.

Any idea about this problem.

Assuming that the two radios are programmed the same (you said they were) and you are using the same antenna on both radios, I would expect the UV-5RB do at least as well as the UV-3R. Is it broken? Maybe. Maybe not.

How well to the radios work between each other on a simplex frequency, each with their respective stock antenna? The UV-5R family of radios are not known for having very selective receivers. I am wondering if the gain of the 5/8 wave antenna is overloading the receiver with signals from other VHF services like paging transmitters and the like. Just something to consider.

Another thing you could do to test the UV-5RB is to put it in reverse mode. Then you and someone else could communicate directly between the two radios on the repeater frequency to see if the UV-3R loses the UV-5RB before the UV-5RB loses the UV-3R as you get farther apart.

This looks pretty specific:
http://www.gpo.gov/fdsys/pkg/CFR-2009-title47-vol5/pdf/CFR-2009-title47-vol5-part95.pdf
GMRS is delineated in Part 95 Subpart A, and elsewhere.
MURS is delineated in Part 95 Subpart J, and elsewhere.

I got several kilometres on 434 Mhz with 20mw ERP under real world conditions.
I believe the record for FRS is 140 miles mountain to mountain.

UHF CB is very good with 80 channels, 5 watts FM, external antennas,
and repeaters.

a slim-jim is the best omnidirestional antenna. google it. they are a easy build and parts are cheap. either a wire slim-jim or a tubbing slim-jim work great and have the lowest angle of propagation putting all you power where you need it instead of up at the birds. it is said to be 8db gain over the j-pole

Hello everyone. My name is Dennis, and I live in Red Bluff Calif.
I bought a UV-5RA recently, and like it so much I bought another one earlier tonight.
I program mine manually, and that took quite a while to master. Easy as pie now.

Hi Dennis,

Welcome to the group.

I agree. Manually programming the radio is much easier than its reputation would lead you to believe.

If you haven't already, visit the Miklor.com website. It has a wealth of information about the UV-5R family of radios plus some other Baofeng models.

73,
Jim KC9HI

Barry, CERT is not a commercial venture. It is a disaster response organization. Usually sponsored by a fire dept. or emergency management agency.

Anyone know where to buy a replacement display board. I tried the backlight button mod (solder a diode on one of the surface mount resistors) and damaged the copper track.

Please fix your formatting,

At 02:20 AM 24/10/2013, you wrote:
For the most part I totally agree with you. I've seen FRS used very
well in small business communications (remember ham radio can't be
used for business purposes). GMRS, we use it here all the time to
talk 10, 20 and sometimes more. And we use it for event
communications some 30+ times a year. As much as you enjoy being a
ham, not everyone wants to be one. My wife is one, GMRS is all she
wants. This is true of the average GMRS/FRS user. Personally I
became a ham to supplement my GMRS needs. There are times when we
need to cover areas to far apart to be effective using GMRS simplex.
At those times bing able to use a ham repeater would be beneficial.
Each service has a need or they wouldn't exist. Gary

And, exactly why would that be, Craig.

CERT teams are intended to be purely local and are intended to operate entirely without outside support. CERT teams operated for years with runners as "their main communication system" and that system is still reasonably effective. FRS radios have the advantage of being both inexpensive and LEGAL (unlike the GMRS radios that most CERT teams actually use).

> Surely somebody there has explained that a Tech
> license is so easy to get now there really is no
> valid excuse anymore to not have it, haven't they?

So what is the NEED for a CERT team to have everyone study for yet another test (which contributes nothing to their ability to perform their CERT function) and buy a complicated radio that costs twice what an FRS radio does (an that assumes they buy just a cheap Chinese HT)?

> If there is ever a large tsunami that hits the northwest
> (and I pray that doesn't happen), those FRS radios will
> be as worthless as cell phones on 9/11 in New York City.

Actually the FRS radios will be completely adequate for the pairs of CERT members to talk to other pairs of local CERT members and to their team leader -- which is ALL the communications that a CERT team needs. CERT Teams do not need nationwide communications, or even city-wide or county-wide communications. All the communications needs of a CERT Team are within the team.

Hams love to invent some mythical need for everyone to talk all over the world, or at least all over the region. That's fine for a hobby; and there are some valid emergency communications missions for both long distance and regional communications -- BUT those missions do not include CERT. CERT (as such) is active only as long as professional first responders are unavailable so there is very little reason for CERT teams to need a capability to talk to anyone outside their immediate area.

There are some reasons why a CERT team might want longer range communications as their CERT mission starts winding down -- and ONE ham radio could be a good way to provide such communications. On the other hand, there is a strong possibility that the ham will be sitting there

looking at his HT wondering why he can't talk to anyone because as a Tech he never had to memorize the answer to question: What do you do when the repeater is down.

I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

The question is, help me understand why it makes a diffeence that FRS radios should not be more than 1/2 watt, why do the antennas have to be permanent. I am a why person, and I understand I can't use my radio on a FRS frequency, but I don't understand why. Helping people understand the why's makes me a more informed user of any technology.

And if this has been covered before4...and I am sure it has, that is OK, there were 116 new users in the last 7 days...for a reason.

Thanks for your input...but make sure it is not broadcast at more than 1/2 watt...

FRS = Family Radio Service. These radios will be used by people, including children, who have little or no understanding of radio, interfering, good operating practice, etc.

1/2 watt limit - to limit range and thus, the amount of area they can screw up.

Fixed antennas - so that antennas with more gain, amplifiers, and other devices cannot be attached that may be used to increase range.

Like wireless routers, every effort is made to LIMIT range so as to not cause interference to other users on the same frequency.

FRS, just like wireless routers, is not and never was intended for long range communications.

Paul - AE5JU

One of the reasons behind these frs, gmrs, etc laws is they don't want people with no knowledge of radios messing around with things they don't undersrand. These are meant to be 'radios for dummies' in this instance. That is why the menus come locked usually on the radios. Not even Police and Fire chiefs can program their own radios as most of them do not undersrand repeater offsets, tones, etc. you will hear such things as 'goto ops' or 'channel 3. They couldn't care less what freq they are on or what trunking is. All they care about is if the radios work for what they need. Licensed ham radio operators have demonstrated at least a basic knowledge of radios and how they work, and have thusly been granted extra priveleges of being able to program their own radios, within CERTAIN LEGAL LIMITS. It is expected they would follow those rules or face consequences. The FCC rules for hams make allowances for doing whatever is necessary to communicate 'in an emergency, when no others means are available'. This means don't use a ham radio on frs if you can use a cellphone, etc. the other radio services (frs, gmrs, murs) do not have those provisions, as the legal equipment for those services cannot be changed to work in other services like ham radio can. Most commercial and public safety services gave to have their radios programmed by a radio service tech (NOT a ham technician). This was almost always the case before Wouxun and Baofeng (and now a few others) started getting type accepted radios.

How close are you holding the radio to your mouth?

You need to be within about an inch. It's designed for high noise environments.

I've had no complaints on mine using it that way.

Arrow makes several antennas. I have not been following the Arrow antenna thread beyond noting that it has wandered off in several directions, so I can't say which particular Arrow antenna each of the people have suggested. The one that I noticed was a basic ground plane, not a J-pole although I see that Arrow does offer a J-pole as well as other designs.

Gain in an omnidirectional antenna is nearly non-existent and certainly not an important concern.

Antenna "Gain" is a TANSTAAFL situation (There Ain't No Such Thing As A Free Lunch!). Starting with the same amount of RF going up the cable to the antenna, the only way ANY antenna achieves "gain" is by concentrating the outgoing signal in one direction at the expense of some other direction.

Directional antennas (such as Yagi antennas) can have significant gain - but this is accomplished by concentrating the signal in one direction and sharply reducing both transmission and reception to the sides and back.

An omnidirectional antenna CANNOT do that. The only directions it can reduce signal strength are up and down -- but the simple fact is that nearly all practical vertically polarized antennas already do that. At VHF, UHF, and above, it is possible to design an antenna that concentrates most of the energy towards the horizon (in fact, some antennas such as those on cell towers even concentrate the energy below the horizon).

Any "Gain" numbers are always relative -- and you will notice that most antenna advertisements do not mention relative to what. The most honest comparison would be relative to a half-wave dipole (listed as dBd for deciBels relative to a dipole), but it is much more common to list gain relative to a mythical isotropic radiator (an imaginary point source antenna that would radiate equally in a spherical manner) this is listed as dBi (deciBels relative to an isotropic radiator). Using dBi instead of dBd

makes the number automatically 2.15 higher because a dipole has 2.15 dB gain relative to the mythical isotropic radiator.

To go back to your question about selecting a base antenna, first of all forget about gain - the differences are not meaningful in practical use.

The factors you should consider include:
- Suitability for your intended frequencies
- Materials and construction quality
- Where and how you intend to mount the antenna.
- Appearance

The importance of these factors may vary a little from one user to another, but I have listed them in the order I think is likely.

Suitability for your intended frequencies is usually a Yes-or-No decision -- at least initially. If you are in an area with both 2m and 70cm repeaters, then you probably want a dual band antenna suitable for operating on both bands. If you only have 2m repeaters in your area, then you would be much less concerned about the 70cm performance of any base antenna.

Most dual band antennas rely on the APPROXIMATE 3x relationship between the frequencies of the 2m and 70cm ham bands. A resonant antenna on a 2m frequency will tend to also be resonant at 3x that frequency. Thus an antenna resonant at 146.000 MHz will typically also be resonant at 438 MHz. Unfortunately, most of the common 70cm repeater frequencies are above 440 and many are above 444 MHz, meaning that the corresponding 2m frequency would be just above the ham band. A dual band antenna for repeater operation needs quite a wide frequency range. Generally speaking, the more gain ANY antenna has, the more narrow its frequency range for good performance.

One advantage to the "dual band" J-pole antenna design is that (unlike most other "dual band" designs), it actually includes separate elements for each band. If you look at a picture of a dual band J-pole antenna (not one of the flexible ones made of twin-lead) you will usually see THREE vertical elements. The two longest elements are actually the 2m antenna, while the two shorter elements are really the 70cm antenna. If you have a good VHF/UHF SWR meter and work carefully, you can separately adjust the J-pole to work well on each band. Keep in mind that for good accuracy, the SWR measurements need to be made with the antenna mounted where and how you want it -- not on the table in your workshop. [Note there are some "dual band" J-pole designs with only two vertical elements - these are basically a 2m J-pole that relies on the 3x relationship between the bands]

The other three factors tend to work together, you want an antenna that will withstand the weather where you have it mounted and you probably want an antenna that isn't God Awful Ugly. How important appearance is will depend on considerations such as whether or not you have a wife and whether or not you live in a subdivision with stupid rules and/or annoying neighbors.

Depending on your mechanical skills, you could build your own ground plane or J-pole antenna (plans for both designs are readily available online) for about $20 or less. The Radio Shack 20-176 antenna is listed as a "scanner" antenna but works well enough on both 2m and 70cm (it sells for $30 now, it used to sell for $20, then for $25, but prices do keep going up). The Radio Shack 20-043 at $80 works better but there are plenty of cheaper & better choices available. The Arrow Antenna model GP146/440 or model OSJ 146/440 for $40 are good choices if you don't want to build one from scratch (at half that cost).

There is nothing wrong with the vertical that your friend suggested although I will admit a slight personal tendency to distrust any antenna described as "pre-tuned at the factory and should not
require any tuning" simply because real world mounting will generally have at least some impact on the resonance of any antenna and "should not require any tuning" in this case means that there is no way for the user to adjust the tuning of the antenna. Still, if the antenna is erected on a proper mast, well clear of the house and all other objects, it ought to perform well without any tuning.

Has anyone tried this cable to program through RS232 serial port? (link <http://www.hamradio.in/circuits/baofeng_uv5r.php?sid=2719cd2d29f9fe681a2d27bba5024e03>)

I have fear of damaging my newly purchased UV-5R

Thank you!

Not many computers have a 9 pin serial port anymore, but I may have to dig up an old IBM ThinkPad unit just to get access to one. If you are lucky enough to have one, I'd call Kurt and get one of his cables. Shipping one from India would be way more expensive (hi, hi).

Not that I disagree with the idea of using LMR400 (especially if it is the "real" stuff) and good quality N-connectors for UHF, I just think it's a little humorous to think that the cost of the LMR400 coax, N connectors, and adapters to the N connector will exceed the cost of the UV-5R, and many on this forum shop all over China (and back) to save $.50 cents on the purchase price of their UV-5R radio (or the USB cable to program it).

Well, considering the message he sent that I, like others on the list have already commented, looked nothing like what is quoted in your response, I would say the problem is somewhere between Yahoo's servers and your email client.

35785. RE: Re: [baofeng_uv5r] CERT Communications

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-24 20:35:44 UTC
From: <allonclark@...>
Topic: 35698 Message: 35785

When I purchased my first ham radio I told a friend and was surprised he had a license since 2002. He ordered a Baefong too, but after several months still has not figured out how to program it manually or with the cable.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Theory says a Technician licensed ham 'should' know more about radios than someone unlicensed, but I heard one operator ask 'I have a call sign?' That IS scary. Some hams are CBers that got lucky on a test. How can you be a ham radio operator if you don't know how to operate your ham radio?

Sent using sidewalk chalk.

On Oct 24, 2013, at 12:44, Craig Carnahan <craig.n7lb@... mailto:craig.n7lb@...> wrote:

Why would that be, Xuan? Well, let me count the ways.

One, FRS gear is highly unreliable for several reasons. At 1/2 watt (and at UHF frequencies) and with no means of changing to a better performing antenna, most folks are lucky to get a range of a few hundred yards, let alone worry about interference a county or two over. That may be fine if one CERT member sits in a Jeep, boat, etc. while another checks the house directly in front of them, but it's hardly the best tool for the job.

Second, since virtually every big box store has sold FRS radios for years, it's a good bet that CERT teams will constantly have the potential for interference, and the likelihood the everyone in the area will suddenly stop talking on all FRS frequencies used by CERT teams is fairly remote, since they also have a right to use the same frequencies as any CERT team.

Third, since most FRS users know how to change their "privacy codes" and at least a (hopefully) small percentage of them still have that "CB" like mentality, it's also likely that CERT teams will also experience intentional jamming or interference when they suddenly show up on the local FRS user's frequency.

Fourth, even if CERT members get zero intentional interference, any end-user monitoring their FRS conversations could easily overpower the 1/2 watt FRS communications by using a UV-5R radio (for example) and any form of outdoor antenna. That could easily lead to CERT teams running around in circles trying to respond to calls asking for assistance well outside their highly local coverage area, or have multiple teams working on the same issue. Either way, a waste of both time and resources for CERT teams.

Fifth, FRS communications are limited to strictly simplex communications, while amateur radio is not, so if the Technician Class license holder (that you have so little faith in I see) can't work the repeater (if it is down), and can't work any additional repeaters in the area either (there are usually more than one just about everywhere nowadays), he (or she) can still use 4 to 5 watts on simplex with their HT (unlike the 1/2 watt on FRS), or

use a mobile VHF/UHF higher power radio (unavailable on FRS), and can also swap out the antenna (on the HT or mobile) for a better performing antenna with gain (again, totally unavailable on FRS).

When reliable communications becomes critical (as they do so often during emergencies or disaster situations), the LAST thing I would want to have folks count on are tiny underpowered 1/2 watt FRS radios with rubber resistors for an antenna that can be easily jammed (intentionally or not) by thousands of folks that have the same radios on the same frequencies purchased at their local K-Mart, WalMart, etc..

Granted, any radio (that can transmit) is better than no radio at all, but with so many better choices than FRS it's crazy to even consider FRS as a "primary" communications tool for EMCOMM.

As for testing, if any CERT member can't pass a multiple choice test that only requires 26 right out of 35 questions (with the feds now giving you both the test questions and the test answers up front), I really not sure I'd want those folks as part of the CERT team out trying to "help" my community during any disaster, be it natural or made-made. We're talking a "C" score (74%) on the virtually open book FCC Technician Class test, not an "A". To be fair, I don't want a doctor working on me that barely made it through medical school either, unless I have no choice.

As others have said, use FRS for what it was primarily intended for, which is chit-chat radio for kids, mom's at playgrounds, etc. Use higher power radios (be they GMRS, MURS, or even Marine band radios) for the folks you still want in CERT that aren't able to score a "C" on an open book test for their amateur radio license.

BTW, when's the last time you ever heard of FEMA or the Red-Cross calling out for volunteers to man their FRS radios during a disaster? Answer - NEVER, and there's plenty of good reasons why. Now you know too.

On Thu, Oct 24, 2013 at 8:58 AM, Xaun Loc <xaunloc@... mailto:xaunloc@...> wrote:
From: Craig Carnahan

> I pity your area if your CERT team is actually trying to
> use 1/2 watt FRS radios as their main communication
> system.

And, exactly why would that be, Craig.

CERT teams are intended to be purely local and are intended to operate entirely without outside support. CERT teams operated for years with runners as "their main communication system" and that system is still reasonably effective. FRS radios have the advantage of being both inexpensive and LEGAL (unlike the GMRS radios that most CERT teams actually use).

> Surely somebody there has explained that a Tech
> license is so easy to get now there really is no
> valid excuse anymore to not have it, haven't they?

So what is the NEED for a CERT team to have everyone study for yet another test (which contributes nothing to their ability to perform their CERT function) and buy a complicated radio that costs twice what an FRS radio

does (an that assumes they buy just a cheap Chinese HT)?

> If there is ever a large tsunami that hits the northwest
> (and I pray that doesn't happen), those FRS radios will
> be as worthless as cell phones on 9/11 in New York City.

Actually the FRS radios will be completely adequate for the pairs of CERT members to talk to other pairs of local CERT members and to their team leader -- which is ALL the communications that a CERT team needs. CERT Teams do not need nationwide communications, or even city-wide or county-wide communications. All the communications needs of a CERT Team are within the team.

Hams love to invent some mythical need for everyone to talk all over the world, or at least all over the region. That's fine for a hobby; and there are some valid emergency communications missions for both long distance and regional communications -- BUT those missions do not include CERT. CERT (as such) is active only as long as professional first responders are unavailable so there is very little reason for CERT teams to need a capability to talk to anyone outside their immediate area.

There are some reasons why a CERT team might want longer range communications as their CERT mission starts winding down -- and ONE ham radio could be a good way to provide such communications. On the other hand, there is a strong possibility that the ham will be sitting there looking at his HT wondering why he can't talk to anyone because as a Tech he never had to memorize the answer to question: What do you do when the repeater is down.

I've got two of them. One is a UV-5S which was a special production run I got off e-bay and the other is the UV-5RAX (NOT AX+) from Radio-Mart.

The UV-5RAX is the better radio although they both work.

There are two MURS frequencies where that might very well be perfectly
legal.

The two 154.xxxx MHz frequencies were transferred from Part 90 to Part 95
when MURS was created -- but users who held a valid Part 90 license on those
frequencies were grandfathered to continue using them under the Part 90
rules applicable to their license.

Most of the "misconception" about radios in this group comes from the deliberate disinformation that gets posted by one particular troll -- named Emmett Gulley

> First, The FCC doesn't have a rule or a part designating
> a murs specific radio like most of the idiots in here claim.

You are clearly unable to read any of Part 95, but I'm sure that many of the people here are able to read Part 95 and could easily find section 95.603(g) which is the rule you said doesn't exist.

And for those who aren't comfortable with the technical side of government regulations, there is a fairly decent explanation of MURS radio certification requirements on the website at https://sites.google.com/site/mursradio2/mursradiocertificationforpart95

That's true -- although there undoubtedly are several 2m simplex frequencies available rather than just one or two.

At the same time, depending on the complexity of the response and how talkative the team members are, all seven legal FRS frequencies could easily get overloaded too.

Craig

not everyone buys the cheapest items, and there is nothing wrong with buying something for less if you do it for the right reasons.

Shortly I bought my radio from Threeoldcrows, I listened to a recommendation from someone in this group and spent $30 buying a Smiley 270a antenna for it....guess what...the stock antenna...to me... seems better. I have since bought 2 other replacement antennas..and the Smiley is unused....I guess part of the fun in life is trying things and having challenges or goals....even though I only have my Tech License 2 months, I am trying to experiment on my own as well as learn with the help of other more experienced individuals....hence all of my questions

Xaun,

Actually, using multiple frequencies within the Amateur Radio Service can create undesirable chaos when it's not needed, since at least one station, acting as net control, would have to be monitoring all of them to be sure nothing important was missed. Messages can be relayed to the NCS (Net Control Station, for those not familiar with it) from any other service, so long as there is no use of amateur frequencies for things that are not permitted.

Mr Pryor,

good comments.

Unfortunately I do not want to go with a directional that I have to rotate. I am trying to keep things somewhat simple.

BTW, my local ham suggested I use RG58 cable with a 259 connector since they are easy to install.....

WRT the UV5R receiver, I thought I had read that the RX section was pretty good, with good sensitivity but not selectivity???

T

Antennas are like firearms, you get a couple different ones to suit your needs and functions. You probably will end up with all of them listed from car mounts, to J poles and directional types like Yagi's.

If you do get a directional antenna insure you get everything including the ability to move and rotate the antenna such as a motor control and good stable mast system. I would not use anything LESS than something like LMR400 and would use N connectors for the higher end antenna systems.

Nothing like getting a new $$ antenna system to find out your 100 ft of Rg58 has so much loss attenuation that it does not do anything for you.

UHF is more tricky than VHF so the connectors and cables are important.

Most of these types of setups I would use with a good car mobile unit as a base station, not the uv5 due to the receiver and lack of decent squelch circuitry. However, I do have these things for emergency use with and without a battery booster unit if all I have handy is a HT to use in an emergency.

Arrow
makes several antennas. I have not been following the Arrow antenna
thread
beyond noting that it has wandered off in several directions, so I
can't say
which particular Arrow antenna each of the people have suggested.
The one
that I noticed was a basic ground plane, not a J-pole although I see
that
Arrow does offer a J-pole as well as other designs.

> The price is
about the same, but the gain a bit higher for the

the 5R, but I assume that
> ultimately I might also buy a mobile or full
range transceiver
> for home....but nothing is certain.

Gain in an
omnidirectional antenna is nearly non-existent and certainly not
an
important concern.

Antenna "Gain" is a TANSTAAFL situation (There Ain't
No Such Thing As A Free
Lunch!). Starting with the same amount of RF going
up the cable to the
antenna, the only way ANY antenna achieves "gain" is by
concentrating the
outgoing signal in one direction at the expense of some
other direction.

Directional antennas (such as Yagi antennas) can have
significant gain - but
this is accomplished by concentrating the signal in
one direction and
sharply reducing both transmission and reception to the

sides and back.

An omnidirectional antenna CANNOT do that. The only directions it can reduce signal strength are up and down -- but the simple fact is that nearly all practical vertically polarized antennas already do that. At VHF, UHF, and above, it is possible to design an antenna that concentrates most of the energy towards the horizon (in fact, some antennas such as those on cell towers even concentrate the energy below the horizon).

Any "Gain" numbers are always relative -- and you will notice that most antenna advertisements do not mention relative to what. The most honest comparison would be relative to a half-wave dipole (listed as dBd for deciBels relative to a dipole), but it is much more common to list gain relative to a mythical isotropic radiator (an imaginary point source antenna that would radiate equally in a spherical manner) this is listed as dBi (deciBels relative to an isotropic radiator). Using dBi instead of dBd makes the number automatically 2.15 higher because a dipole has 2.15 dB gain relative to the mythical isotropic radiator.

To go back to your question about selecting a base antenna, first of all forget about gain - the differences are not meaningful in practical use.

The factors you should consider include:
- Suitability for your intended frequencies
- Materials and construction quality
- Where and how you intend to mount the antenna.
- Appearance

The importance of these factors may vary a little from one user to another, but I have listed them in the order I think is likely.

Suitability for your intended frequencies is usually a Yes-or-No decision -- at least initially. If you are in an area with both 2m and 70cm repeaters, then you probably want a dual band antenna suitable for operating on both

bands. If you only have 2m repeaters in your area, then
you would be much
less concerned about the 70cm performance of any base
antenna.

Most dual band antennas rely on the APPROXIMATE 3x relationship
between the
frequencies of the 2m and 70cm ham bands. A resonant antenna on
a 2m
frequency will tend to also be resonant at 3x that frequency. Thus an
antenna resonant at 146.000 MHz will typically also be resonant at 438 MHz.
Unfortunately, most of the common 70cm repeater frequencies are above 440
and many are above 444 MHz, meaning that the corresponding 2m frequency
would be just above the ham band. A dual band antenna for repeater
operation needs quite a wide frequency range. Generally speaking, the more
gain ANY antenna has, the more narrow its frequency range for good
performance.

One advantage to the "dual band" J-pole antenna design
is that (unlike most
other "dual band" designs), it actually includes
separate elements for each
band. If you look at a picture of a dual band
J-pole antenna (not one of
the flexible ones made of twin-lead) you will
usually see THREE vertical
elements. The two longest elements are actually
the 2m antenna, while the
two shorter elements are really the 70cm antenna.
If you have a good
VHF/UHF SWR meter and work carefully, you can separately
adjust the J-pole
to work well on each band. Keep in mind that for good
accuracy, the SWR
measurements need to be made with the antenna mounted
where and how you want
it -- not on the table in your workshop. [Note there
are some "dual band"
J-pole designs with only two vertical elements - these
are basically a 2m
J-pole that relies on the 3x relationship between the
bands]

The other three factors tend to work together, you want an antenna
that will
withstand the weather where you have it mounted and you probably
want an
antenna that isn't God Awful Ugly. How important appearance is will
depend
on considerations such as whether or not you have a wife and whether
or not

you live in a subdivision with stupid rules and/or annoying
neighbors.

Depending on your mechanical skills, you could build your own
ground plane
or J-pole antenna (plans for both designs are readily available
online) for
about $20 or less. The Radio Shack 20-176 antenna is listed as a
"scanner"
antenna but works well enough on both 2m and 70cm (it sells for
$30 now, it
used to sell for $20, then for $25, but prices do keep going
up). The Radio
Shack 20-043 at $80 works better but there are plenty of
cheaper & better
choices available. The Arrow Antenna model GP146/440 or
model OSJ 146/440
for $40 are good choices if you don't want to build one
from scratch (at
half that cost).

There is nothing wrong with the
vertical that your friend suggested although
I will admit a slight personal
tendency to distrust any antenna described as
"pre-tuned at the factory and
should not
require any tuning" simply because real world mounting will
generally have
at least some impact on the resonance of any antenna and
"should not require
any tuning" in this case means that there is no way for
the user to adjust
the tuning of the antenna. Still, if the antenna is
erected on a proper
mast, well clear of the house and all other objects, it
ought to perform
well without any tuning.

Actually FRS is very reliable within its uses.

> At 1/2 watt (and at UHF frequencies) and with no means
> of changing to a better performing antenna, most folks
> are lucky to get a range of a few hundred yards, let alone
> worry about interference a county or two over.

Absolutely true -- which makes FRS perfect for CERT!

> That may be fine if one CERT member sits in a Jeep,
> boat, etc. while another checks the house directly in
> front of them, but it's hardly the best tool for the job.

Actually, FRS would be perfect for that job. But that job is generally outside the scope of CERT because both members of the pair would normally be on foot -- not running around in some "jeep, boat, etc" which would be appropriate only over a much wider area than a CERT is intended to cover.

> Second, since virtually every big box store has sold
> FRS radios for years, it's a good bet that CERT teams
> will constantly have the potential for interference,

Lets see, your first point against FRS radios is that they have short range which prevents them from interfering with anyone far away. Then your next point is that they will get a lot of interference. If they do get interference it would be from someone in the immediate area. If there is a person in the immediate area, then the CERT's job is to check on that person, determine what assistance the person needs, and to help them. So, if that person happens to have an FRS radio and happens to be on the same frequency as the CERT, that just makes it much easier for the CERT to find, evaluate, and assist the person!

> and the likelihood the everyone in the area will
> suddenly stop talking on all FRS frequencies used
> by CERT teams is fairly remote, since they also
> have a right to use the same frequencies as any CERT team.

And, in the middle of a major disaster, exactly what do you suppose these other people with FRS radios would be chatting about??? If there are other people on the FRS radio, they will be talking about where they are, what the situation is there, and what they need -- exactly the information that the CERT needs to get!

> Third, since most FRS users know how to change
> their "privacy codes" and at least a (hopefully)
> small percentage of them still have that "CB" like
> mentality, it's also likely that CERT teams will also
> experience intentional jamming or interference

Oh yes, everyone in the disaster area will be doing their best to prevent themselves from being rescued.

> Fourth, even if CERT members get zero intentional
> interference, any end-user monitoring their FRS
> conversations could easily overpower the 1/2 watt
> FRS communications by using a UV-5R radio (for
> example) and any form of outdoor antenna. That
> could easily lead to CERT teams running around in
> circles trying to respond to calls asking for assistance
> well outside their highly local coverage area,

And just why would a CERT try to respond outside its local area when its entire purpose is to respond only within its local area.

You can dream up all sorts of ways that YOU could harass or interfere with legitimate CERT communications -- but it takes a special kind of idiot to even consider such activities, and there are very few people who are stupid enough to try to prevent their own rescue in an emergency.

> or have multiple teams working on the same issue.
> Either way, a waste of both time and resources for CERT teams.

Apparently you assume that all CERT members are idiots and they they are being led by even bigger idiots.

But absolutely nothing in any of your imagined scenarios is related to FRS -- and substituting ham radios for FRS radios would do absolutely nothing to eliminate intentional interference

> Fifth, FRS communications are limited to strictly
> simplex communications, while amateur radio is
> not, so if the Technician Class license holder
> (that you have so little faith in I see) can't work
> the repeater (if it is down), and can't work any
> additional repeaters in the area either (there are
> usually more than one just about everywhere
> nowadays),

Simplex is the appropriate mode for CERT communications -- which are meant to be local. How many different CERT teams do you suppose would be within the coverage area of a typical repeater? How are the members of those different CERT teams going to communicate through the repeater when EVERYONE on the repeater is babbling about their local situation and really only needing to talk to the guy 100 feet away but instead they have to listen to

everyone in a few hundred square miles?!?!? Repeaters are the worst possible way for any CERT to communicate internally.

> he (or she) can still use 4 to 5 watts on simplex
> with their HT (unlike the 1/2 watt on FRS), or\
> use a mobile VHF/UHF higher power radio
> (unavailable on FRS), and can also swap out
> the antenna (on the HT or mobile) for a better
> performing antenna with gain (again, totally
> unavailable on FRS).

And what exactly is he going to accomplish with more power and a better antenna? All that does is cause more interference to others as well as opening him to interference.

> When reliable communications becomes critical
> (as they do so often during emergencies or disaster
> situations), the LAST thing I would want to have
> folks count on are tiny underpowered 1/2 watt
> FRS radios with rubber resistors for an antenna
> that can be easily jammed (intentionally or not)
> by thousands of folks that have the same radios
> on the same frequencies purchased at their local
> K-Mart, WalMart, etc.. \

Instead you want idiots who think that increasing the power of their radio somehow makes them better communicators -- because with the increased power they get to blast the other idiots off the frequency??

> BTW, when's the last time you ever heard of FEMA
> or the Red-Cross calling out for volunteers to man
> their FRS radios during a disaster? Answer - NEVER,
> and there's plenty of good reasons why. Now you
> know too.

Actually, the last time I saw the Red Cross using FRS radios was a few months ago during our last flood, when FRS radios were used for communications within each shelter. No deliberate interference, and very little unintentional interference. Meanwhile FEMA uses 1/2W fixed antenna UHF radios identical to FRS radios except they they are on different UHF frequencies. The military also uses exactly the same radios for squad communications.

What you totally fail to understand is that there are many different communications requirements and each requirement needs to be accomplished using the most appropriate equipment -- for short range local communications, a low powered simplex radio is typically the best choice and FRS meets that need very effectively unless the immediate area is overrun by idiots whose only thought is how they can interfere with the largest area by using too much power.

Not surprising! There isn't any question about that on the test and most newly licensed hams have never studied anything other than the test question answers.

> That IS scary.

No scarier than many of the questions we see asked here each week. For that matter, I'm not sure that it is much scarier than some of the ANSWERS that we see posted here.

> Some hams are CBers that got lucky on a test.

THAT is an insult to CBers!

> How can you be a ham radio operator if you
> don't know how to operate your ham radio?

Good question. Maybe they ought to add that question to the test question pool.

35801. RE: Memory Programming problem

That explanation helped me VERY much. Somehow, during the 20+ times I tried it, I failed to exit the memory setting mode [27] properly before pressing *SCAN to reverse to the transmit frequency. With your explanation, I was able to do the programming without a hitch. Wonderful.

Also, because I was already sure the chipset was good, it worked on the cable connection issue. That seems to be the problem.

Again, your help was exactly what I needed. Many thanks, Jim.

Hi Bevin,

On Wed, Oct 23, 2013 at 9:17 PM, <bevin.alexander@... mailto:bevin.alexander@...> wrote:
I am new to the group, but been using UV5-Rx for some time. Ham, call sign K4ALE.

Welcome to the group.

I recently ordered a new [3d] HT, in yellow, model UV-5R+Plus. I have always had trouble programming from computers, and have tried an XP, Vista, and new Windows 8 computers with equal trouble. I have, however, gotten comfortable with programming memory channels by hand.

If you have a programing cable with an unauthorized copy of the Prolific USB-to-UART chip, then you have to install a specific older driver. See the Miklor.com website.

http://www.miklor.com/COM/UV_Drivers.php http://www.miklor.com/COM/UV_Drivers.php

However, when I received this new HT, I could not get it to save the offset requiried for repeater function. Everything else saved. It has software version BFS-311. I tried everything, including two different cables and both softwares. It loaded one memory before the software ceased communicating with the radio--and that worked fine. Still no hand programming.

The UV-5R family of radios do not save offsets when writing the data to a memory channel. Instead of an offset and a shift direction, the radios requires the RX frequency and the TX frequency to be provided.

I called the vendor, who very graciously sent me another one. Exact same problem. Everything else works, and programming a repeated in frequency mode is fine.

There is a slight difference I have noticed in the manual procedure: it stores "transmitting frequency" regardless whether I press "*Scan" to reverse after saving the "receiving frequency." That press does nothing.

Menu 27 (MEM-CH) has two distinct modes. To program a memory channel for a repeater requires you to use both modes.

The first mode is used when the target memory channel is empty. The second mode is used when the target memory channel is not empty.

When the target memory channel is empty (the first mode), the VFO [A] frequency and the settings of 9 menus are saved to the target memory channel. The VFO frequency is written to both the RX frequency register and the TX frequency register thus creating a simplex memory channel. The voice prompt is "receiving memory".

When the target memory channel is not empty (the second mode), the VFO [A] frequency and only the settings of 2 menus are saved to the target memory channel. The VFO frequency is written to only the TX frequency register thus updating it. The result is a repeater, split or cross-band memory channel. Also the menu 12 (T-DCS) code and menu 13 (T-CTCS) code are updated. The voice prompt is "transmitting memory".

So if all you are hearing is "transmitting memory", then you are not starting out with an empty target memory channel. You will only hear "receiving memory" when the target memory channel is empty.

Look for Menu Detailed Reference on the Miklor.com UV-5R home page for links to the "Reference for UV-5R Menus". It will likely tell you more about the menus than you want to know.

There must be another way. I have found a reference on line to a "bug" along these lines, but getting two with the same bug is unlikely [not impossible].

Follow any of the UV-5R manual programming guides on the Miklor.com website.

Has anyone discovered the magic sequence to load memories manually?

Yes. See above.

I love these little HTs and would like to solve this problem. Many thanks in advance.

Keypad programming of these radios isn't really that bad once you understand how it works. And you computer programming issues will likely go away once you get the correct driver installed and make sure the 2-pin plug is fully seated into the speaker/mic jack of the radio.

Xuan,

thanks for the detailed reply.

Some comments....

I do live in an HOA with restrictions, but I am not letting that stop me. I already have a butt ugly HDTV in place , and will probably replace it with a dual band antenna .

WRT to the Arrow antennas, yes, I was looking at the J-Pole versions that some other group members had discussed. All the local hams seem to use verticals like the Diamond/Jetstream/Comet for their base stations, but they are also using 50W+ rigs, so their choice of antenna does not seem to be critical.

Ultimately I may buy a "real" rig but for now, the UV5R is my only radio, and with experimenting, I want to see what I can do to get out as far as possible. I am currently playing with some HT replacement antennas with some interesting results, and will post that shortly.

WRT "tuning" an antenna......I have 2 options that I am considering for mounting of an external antenna....the first is to mount it on the very top of the house, which is about 35 ft ASL and near the coast on the flatlands of Delmarva. If it goes there, I will need to pay someone to mount it where the HDTV antenna currently is since I have had too many surgeries and cant climb the roof.

The second option is to "Temporarily" mount it on a 3rd floor deck that is built into the roof ~ 28 Ft ASL. If I do it that way, I will only have it out when I am transmitting, this way I do not need to worry about grounding. But I would be able to tune it in place.

Once again, my challenge/desire, is that I live in an area with relatively few repeaters..and hams... I can easily hit a few repeaters from my deck with my stock antenna. I need to be able to stretch my capabilities so that I am solid into repeaters that are 30 miles away and inland. In another hurricane, I may only have an HT to use because power is out, and a base radio will not work.....and my nearest repeater is off the air due to the storm..... I want to learn what I can get away with with the least complex equipment, learning along the way, then buy more stuff later on.

Based on all that info, does the J-pole still make sense as opposed to the Vertical??

Kind regards

T.

Arrow makes several antennas. I have not been following the Arrow antenna thread beyond noting that it has wandered off in several directions, so I can't say which particular Arrow antenna each of the people have suggested. The one that I noticed was a basic ground plane, not a J-pole although I see that Arrow does offer a J-pole as well as other designs.

Gain in an omnidirectional antenna is nearly non-existent and certainly not an important concern.

Antenna "Gain" is a TANSTAAFL situation (There Ain't No Such Thing As A Free Lunch!). Starting with the same amount of RF going up the cable to the antenna, the only way ANY antenna achieves "gain" is by concentrating the outgoing signal in one direction at the expense of some other direction.

Directional antennas (such as Yagi antennas) can have significant gain - but this is accomplished by concentrating the signal in one direction and sharply reducing both transmission and reception to the sides and back.

An omnidirectional antenna CANNOT do that. The only directions it can reduce signal strength are up and down -- but the simple fact is that nearly all practical vertically polarized antennas already do that. At VHF, UHF, and above, it is possible to design an antenna that concentrates most of the energy towards the horizon (in fact, some antennas such as those on cell towers even concentrate the energy below the horizon).

Any "Gain" numbers are always relative -- and you will notice that most antenna advertisements do not mention relative to what. The most honest comparison would be relative to a half-wave dipole (listed as dBd for deciBels relative to a dipole), but it is much more common to list gain relative to a mythical isotropic radiator (an imaginary point source antenna that would radiate equally in a spherical manner) this is listed as dBi (deciBels relative to an isotropic radiator). Using dBi instead of dBd makes the number automatically 2.15 higher because a dipole has 2.15 dB gain relative to the mythical isotropic radiator.

To go back to your question about selecting a base antenna, first of all forget about gain - the differences are not meaningful in practical use.

The factors you should consider include:
- Suitability for your intended frequencies

- Materials and construction quality
- Where and how you intend to mount the antenna.
- Appearance

The importance of these factors may vary a little from one user to another, but I have listed them in the order I think is likely.

Suitability for your intended frequencies is usually a Yes-or-No decision -- at least initially. If you are in an area with both 2m and 70cm repeaters, then you probably want a dual band antenna suitable for operating on both bands. If you only have 2m repeaters in your area, then you would be much less concerned about the 70cm performance of any base antenna.

Most dual band antennas rely on the APPROXIMATE 3x relationship between the frequencies of the 2m and 70cm ham bands. A resonant antenna on a 2m frequency will tend to also be resonant at 3x that frequency. Thus an antenna resonant at 146.000 MHz will typically also be resonant at 438 MHz. Unfortunately, most of the common 70cm repeater frequencies are above 440 and many are above 444 MHz, meaning that the corresponding 2m frequency would be just above the ham band. A dual band antenna for repeater operation needs quite a wide frequency range. Generally speaking, the more gain ANY antenna has, the more narrow its frequency range for good performance.

One advantage to the "dual band" J-pole antenna design is that (unlike most other "dual band" designs), it actually includes separate elements for each band. If you look at a picture of a dual band J-pole antenna (not one of the flexible ones made of twin-lead) you will usually see THREE vertical elements. The two longest elements are actually the 2m antenna, while the two shorter elements are really the 70cm antenna. If you have a good VHF/UHF SWR meter and work carefully, you can separately adjust the J-pole to work well on each band. Keep in mind that for good accuracy, the SWR measurements need to be made with the antenna mounted where and how you want it -- not on the table in your workshop. [Note there are some "dual band" J-pole designs with only two vertical elements - these are basically a 2m J-pole that relies on the 3x relationship between the bands]

The other three factors tend to work together, you want an antenna that will withstand the weather where you have it mounted and you probably want an antenna that isn't God Awful Ugly. How important appearance is will depend on considerations such as whether or not you have a wife and whether or not you live in a subdivision with stupid rules and/or annoying neighbors.

Depending on your mechanical skills, you could build your own ground plane or J-pole antenna (plans for both designs are readily available online) for about $20 or less. The Radio Shack 20-176 antenna is listed as a "scanner" antenna but works well enough on both 2m and 70cm (it sells for $30 now, it used to sell for $20, then for $25, but prices do keep going up). The Radio Shack 20-043 at $80 works better but there are plenty of cheaper & better choices available. The Arrow Antenna model GP146/440 or model OSJ 146/440 for $40 are good choices if you don't want to build one from scratch (at half that cost).

There is nothing wrong with the vertical that your friend suggested although I will admit a slight personal tendency to distrust any antenna described as "pre-tuned at the factory and should not
require any tuning" simply because real world mounting will generally have at least some impact on the resonance of any antenna and "should not require any tuning" in this case means that there is no way for the user to adjust the tuning of the antenna. Still, if the antenna is erected on a proper mast, well clear of the house and all other objects, it ought to perform well without any tuning.

I have both of these antennas, I use the fiberglass antenna on my extendable mast for Field Day and camping only as it is a bit more compact; I believe that long time outdoor use will damage the fiberglass. On the other hand, the Arrow J-pole is all aluminum and I have had that on my tower for years and other than losing its original shine, it still works and looks great--go for the Arrow antenna. Karl

I have been advised that when choosing the LMR-400 cable, to stick with the Times Microwave Systems brand and that other brands maybe inferior. I wonder if others agree with this? We all know that quality certainly varies in RG8-U types of coax, I think of Belden on these for quality. Karl

On Thursday, October 24, 2013 9:19 PM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

Hello, I guess it is better to look at this chart below, RG58 at 100 feet @ 400 mhz has a loss of 11,2 DB,

At 50 feet this would be 1/2 or 5.6 db at 25 feet 2.8 db.
50% reduction in power happens at 3db.

So if you have a 25 foot cable going to an antenna system hooked up to your uv5R on UHF you are actually getting only @ 2.5 watts out instead of a full 5 watts.

That is a huge loss and remember receive signals coming back down on UHF will experience this loss too.

With LMR 400 the specs would be at @450 mhz 100 feet 2.7 db and at 50 feet 1.35 db and 25 feet .675 db loss (1 db @1.26 loss)

2.8 db compared to .675

Rg58 is great for HF CB and lower freqs but really is not that good for UHF bands.

The PL259 connector is NOT supposed to be used above 300 mhz, so a good system would include an N connector and something such as

LMR 400 or 600. (My new Arrow antenna uses an N connector) This way your antenna and system is best utilized. Your Ham friend is correct for HF but higher freq such as UHF things start to be more tricky with insertion loss issues and attenuation.

Hope this helps better looking at a chart to do comparisons.

I would order LMR400 at the length I needed and have both ends terminated with N connectors. A pigtail would then be used on the uv5R of low loss flex cable SMA F to N . Keep the number of connector changes to a min, as these increase VSWR and insertion loss issues too.

Also do not get more cable then needed if possible, have a service loop extension in case you need an extra few feet, I would measure everything as my system needed 50 foot from bottom to top including run areas.

Attenuation (dB per 100
feet)

Coax Cable Signal Loss (Attenuation) in dB per 100ft*
Loss* RG-174 RG-58 RG-8X RG-213 RG-6 RG-11 RF-9914 RF-9913
1MHz 1.9dB 0.4dB 0.5dB 0.2dB 0.2dB 0.2dB 0.3dB 0.2dB
10MHz 3.3dB 1.4dB 1.0dB 0.6dB 0.6dB 0.4dB 0.5dB 0.4dB
50MHz 6.6dB 3.3dB 2.5dB 1.6dB 1.4dB 1.0dB 1.1dB 0.9dB

antenna

Mr
Pryor,

good comments.

Unfortunately I do not want to go with a
directional that I have to rotate. I am trying to keep things somewhat
simple.

BTW, my local ham suggested I use RG58 cable with a 259 connector
since they are easy to install........

WRT the UV5R receiver, I thought I
had read that the RX section was pretty good, with good sensitivity but not
selectivity???

T

I will add to this great information post some more thoughts.

Antennas are like firearms, you get a couple different ones to suit your
needs and functions. You probably will end up with all of them listed from
car mounts, to J poles and directional types like Yagi's.

If you do get a directional antenna insure you get everything including the
ability to move and rotate the antenna such as a motor control and good stable
mast system. I would not use anything LESS than something like LMR400 and
would use N connectors for the higher end antenna systems.

Nothing like getting a new $$ antenna system to find out your 100 ft of
Rg58 has so much loss attenuation that it does not do anything for you.

UHF is more tricky than VHF so the connectors and cables are
important.

Most of these types of setups I would use with a good car mobile unit as a
base station, not the uv5 due to the receiver and lack of decent squelch
circuitry.   However, I do have these things for emergency use with
and without a battery booster unit if all I have handy is a HT to use in an
emergency.

Arrow makes several antennas. I have not been
following the Arrow antenna
thread beyond noting that it has
wandered off in several directions, so I
can't say which
particular Arrow antenna each of the people have suggested.
The
one that I noticed was a basic ground plane, not a J-pole although I see
that Arrow does offer a J-pole as well as other designs.

Gain in an omnidirectional antenna is nearly
non-existent and certainly not
an important concern.

Antenna "Gain" is a TANSTAAFL situation (There Ain't
No Such Thing As A Free
Lunch!). Starting with the same amount of
RF going up the cable to the
antenna, the only way ANY antenna
achieves "gain" is by concentrating the
outgoing signal in one
direction at the expense of some other direction.

Directional antennas (such as Yagi antennas) can have significant
gain - but
this is accomplished by concentrating the signal in
one direction and
sharply reducing both transmission and
reception to the sides and back.

An omnidirectional
antenna CANNOT do that. The only directions it can
reduce signal
strength are up and down -- but the simple fact is that nearly
all practical vertically polarized antennas already do that. At VHF,
UHF,
and above, it is possible to design an antenna that
concentrates most of the
energy towards the horizon (in fact,
some antennas such as those on cell

towers even concentrate the
energy below the horizon).

Any "Gain" numbers are
always relative -- and you will notice that most
antenna
advertisements do not mention relative to what. The most honest
comparison would be relative to a half-wave dipole (listed as dBd for
deciBels relative to a dipole), but it is much more common to
list gain
relative to a mythical isotropic radiator (an imaginary
point source antenna
that would radiate equally in a spherical
manner) this is listed as dBi
(deciBels relative to an isotropic
radiator). Using dBi instead of dBd
makes the number
automatically 2.15 higher because a dipole has 2.15 dB gain
relative to the mythical isotropic radiator.

To go back to your question about selecting a base antenna, first of
all
forget about gain - the differences are not meaningful in
practical use.

The factors you should consider
include:
- Suitability for your intended frequencies
- Materials and construction quality
- Where and how
you intend to mount the antenna.
- Appearance

The importance of these factors may vary a little from one user to
another,
but I have listed them in the order I think is
likely.

Suitability for your intended frequencies
is usually a Yes-or-No decision --
at least initially. If you are
in an area with both 2m and 70cm repeaters,
then you probably
want a dual band antenna suitable for operating on both
bands. If
you only have 2m repeaters in your area, then you would be much
less concerned about the 70cm performance of any base antenna.

Most dual band antennas rely on the APPROXIMATE 3x
relationship between the
frequencies of the 2m and 70cm ham
bands. A resonant antenna on a 2m

frequency will tend to also be
resonant at 3x that frequency. Thus an
antenna resonant at
146.000 MHz will typically also be resonant at 438 MHz.
Unfortunately, most of the common 70cm repeater frequencies are above
440
and many are above 444 MHz, meaning that the corresponding 2m
frequency
would be just above the ham band. A dual band antenna
for repeater
operation needs quite a wide frequency range.
Generally speaking, the more
gain ANY antenna has, the more
narrow its frequency range for good
performance.

One advantage to the "dual band" J-pole antenna design
is that (unlike most
other "dual band" designs), it actually
includes separate elements for each
band. If you look at a
picture of a dual band J-pole antenna (not one of
the flexible
ones made of twin-lead) you will usually see THREE vertical
elements. The two longest elements are actually the 2m antenna, while
the
two shorter elements are really the 70cm antenna. If you have
a good
VHF/UHF SWR meter and work carefully, you can separately
adjust the J-pole
to work well on each band. Keep in mind that
for good accuracy, the SWR
measurements need to be made with the
antenna mounted where and how you want
it -- not on the table in
your workshop. [Note there are some "dual band"
J-pole designs
with only two vertical elements - these are basically a 2m
J-pole
that relies on the 3x relationship between the bands]

The other three factors tend to work together, you want an antenna
that will
withstand the weather where you have it mounted and you
probably want an
antenna that isn't God Awful Ugly. How important
appearance is will depend
on considerations such as whether or
not you have a wife and whether or not
you live in a subdivision
with stupid rules and/or annoying neighbors.

Depending on your mechanical skills, you could build your own ground plane
or J-pole antenna (plans for both designs are readily available online) for
about $20 or less. The Radio Shack 20-176 antenna is listed as a "scanner"
antenna but works well enough on both 2m and 70cm (it sells for $30 now, it
used to sell for $20, then for $25, but prices do keep going up). The Radio
Shack
20-043 at $80 works better but there are plenty of cheaper & better
choices available. The Arrow Antenna model GP146/440 or model OSJ 146/440
for $40 are good choices if you don't want to build one from scratch (at
half that cost).

There is nothing wrong with the vertical that your friend suggested although
I will admit a slight personal tendency to distrust any antenna described as
"pre-tuned at the factory and should not require any tuning" simply because real world mounting will generally have
at least some impact on the resonance of any antenna and "should not require
any tuning" in this case means that there is no way for the user to adjust
the tuning of the antenna. Still, if the antenna is erected on a proper
mast, well clear of the house and all other objects, it ought to perform
well without any tuning.

>>> I think the FCC learned from the CB service. Just like Ham Radio, the available equipment lends itself easily to “enhancement”, legal or otherwise. It’s become virtually impossible to enforce regulations in all but the most egregious cases. It’s much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

Hi Karl,

If the attenuation, flexibility and durability are the same, I'm not sure
the brand matters too much.

I've been happy with these guys:
http://www.jefatech.com/product/CA-400-C1-C2-L

Their made-to-order cables and pigtails are great.

Have you tried re-installing KK7DS Python runtime and/or the USB-Serial drivers? Probably updating over the weekend so will find out if I have the same issue.

The system couldn't handle the load although the local media played it off as the "towers went down". Really? Unofficial measurement - only one out of eight cell phones worked on the Jersey side of the Hudson. The poor cops and firemen were desensing each others radios but the ham stuff seemed to work fine FWIW.

>>>>
>>>> Very good answer by John Bee N1GNV. However, the 20 mile example should be more like 20 blocks. FRS is really intended as a VERY short range service. As soon as you enable the ability to get more range, you now have the absolute likelihood of causing harmful interference with other FRS users who are not using higher power or external antennas. You can't hear them, but they can hear you. Just like using a CB with an external amplifier. It accomplishes nothing and hurts a lot.
>>>>
>>>>
>>>>
>>>> So the rules were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.
>>>>
>>>>
>>>>
>>>> But, if someone in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency communications system they designed and implemented.
>>>>
>>>>
>>>>
>>>> Those are the reasons behind these particular rules. There are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We’ll never hear each other, and so we can share the frequency with no problem. As a Ham, I’m always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they’re effectively limiting my range.

One point. CB was originally licensed but so many used it unlicensed and illegally that I think the FCC just gave up on licenses.

Again, the discussion was about "reliable" communications. While it's good to know that one individual's cell phone worked when he needed it to, the reality is that the vast majority didn't soon after the buildings came down. The same can be said about the various incompatible digital communication public service systems within NYC as well. It was weeks after the buildings collapsed before the cellular companies had anything resembling "reliable" communications in the NYC area.

Again, I'm not saying to never use FRS, I'm simply saying that there are far more powerful and much more reliable communication systems in place vs. FRS radios. I hope that there's never another 9-11 style attack, but if there was any good at all from it at least the various public sector folks now realize many of the communication system mistakes that were made previously so hopefully those won't be made again.

Well, it seemed that cell phone service on the Jersey side was almost normal by that afternoon, so I guess the load here lightened by then. From that and Sandy. I'm not that impressed with them. Make good night lights when the power is out though. BTW I almost always have a rig with me.

One point about using FRS radios I think all have missed so far. A non licensed individual can not legally transmit on ham, GMRS, MURS, Public Safety or even commercial radio frequencies. However they can use a cheap, toy radio to possibly call for help. It's the only service (except a cell phone) I know of that any license user can legally communicate with a non license user without having to meet strict FCC guidelines. FRS Channel 1, no tone, is an unofficial Emergency Calling frequency.

Actually, there is no such thing in the U.S. as "license free". CB, FRS, MURS are all License By Rule (which is NOT the same thing as "license free". By rule, the FCC has granted license to all eligible people to operate on selected frequencies, providing they do so in compliance with the established regulations for those frequencies and the applicable radio service. Failure to operate in accordance with the applicable regulations is a violation of that license and subjects the violator to the possibility of penalty.

Part of the applicable rules very specifically state what equipment is and is not allowed for use on any particular radio service or set of frequencies. It is absolutely NOT true that "if the radio has the freqs it can be used". What YOU don't get is that there ARE regs/rules pertaining to EVERY SINGLE POSSIBLE RF EMISSION WITHIN THE BOUNDARIES COVERED BY THE FCC.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

NOPE, ALL Murs freqs are now license free. and if the radio has the freqs, it can be used.

That's what alot of you don't get. There are no regs are rules pertaining to "brand" radios in the situations we have been discussing about.

I have been wondering why you just don't ASK the FCC yourself instead of pushing two parts that don't govern everything

> Hell, To save money, one local wal-mart here
> uses nothing but Uv5R's on MURS freqs.

There are two MURS frequencies where that might very well be perfectly
legal.

The two 154.xxxx MHz frequencies were transferred from Part 90 to Part 95
when MURS was created -- but users who held a valid Part 90 license on those
frequencies were grandfathered to continue using them under the Part 90
rules applicable to their license.

35825. Does the 3600mah battery improve ground?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-25 06:57:43 UTC
From: <aurich85@...>
Topic: 35825 Message: 35825

I just received and installed the 3600mah battery on my UV-5R yesterday and it seems to me that the TX/RX performance is slightly better on a few of the repeaters in my area that generally have marginal reception. It occurred to me that the larger battery might be providing a larger ground plane, therefore improving performance, but I have no real way to prove/disprove this theory. After all it could simply be my imagination but I definitely thought a few repeaters sounded better with the larger battery installed. On another note, the larger battery really gives you a better grip when you're walking around with the radio, and makes it easier to manage buttons on the keypad if you have big hands like I do. Would love to hear any thoughts or findings with the 3600mah battery from anybody else.

Hi, Ive had two of these beauties for 6 months and think theyre great fun even though I have Yaesu' s and a Kenwood. Yesterday got a 'hi gain' whip off flea-bay. . I usually have the local ports shipping on 156.700 and find this is now breaking the squelch all the time with pager break-through. No such problem with the more expensive handies so the front end is very susceptible.Ive gone back to the stock antenna and still carry one most of the time.

> BTW, my local ham suggested I use RG58 cable with

RG58 is ok for short lengths, if you are going over 50 feet, I would suggest low loss RG8X or RG8U or better to reduce the line loss.

You can use the calculator at http://timesmicrowave.com/calculator/ to give you precise figures for the line loss of most kinds of coax cable. Unfortunately the calculator gets its precision by using specific kind of cable, the specific frequency and the specific length of cable and will only calculate one set of numbers at a time.
The charts at http://www.w4rp.com/ref/coax.html or http://www.universal-radio.com/catalog/cable/coaxperf.html are easier to use to compare cable types but give less precise figures.

Keep in mind that 3 dB of loss means that only half your RF power output even reaches the antenna; 6 dB of loss would mean 1/4 of your signal reaches the antenna, 12 dB loss means that 1/16th of your signal reaches the antenna -- and, of course, you lose the same amount of received signal strength in the other direction as well.
On the 2M ham band, if you use 100 feet of RG-58 roughly 1/4th of your signal reaches the antenna.
On the 70cm ham band, if you use 100 feet of RG-58, a little less than 1/10th of your signal will reach the antenna.

> a 259 connector since they are easy to install........

Nothing really wrong with the PL-259 (not quite as good as any of the N connectors, but ok and generally easier to work with if you are installing the connectors yourself). You can certainly save some money by ordering the actual length of cable you need and installing your own connectors, but it is a lot simpler and generally more reliable to order cable with the connectors professionally installed, especially if the length you need is just a little less than one of the standard lengths.

You will almost certainly need to use a PL-259 at the antenna-end of your coax unless you special order an antenna with a different connector or built the antenna yourself.

At the radio end of the cable you have a more complicated situation. The connector on the radio requires a SMA-F connector on the coax. Even RG-58 is a bit stiff and will put considerable strain on the antenna connector of the radio -- especially if you keep picking up the radio to talk on it while it is attached to the coax for your base antenna. You will almost certainly need some sort of adapter to connect the coax to the radio. The obvious choice is an SMA-F to SO239 adapter -- DON'T DO THAT!!! It will put way too much strain on the connector on the radio. Instead get a pigtail adapter made with either RG316 or RG174 coax. DO NOT use ANY solid adapter

and avoid even the pigtails made with RG58 if you are going to be handling the radio very much (this is less of a problem if you use a speaker mic instead of picking up the radio itself each time you want to transmit). One suitable pigtail would be eBay item 150622254338 but Kurt at Three Old Crows has a much better pigtail for only a few dollars more.
http://threeoldcrows.com/shop/magento/uhf-so239-female-jack-to-sma-female-with-nut-pigtail-jumper-cable-rg316-1-meter-in-length.html
If that link is broken just go to the Three Old Crows store home page at http://threeoldcrows.com/shop/magento/ and use the site search to look for PIGTAIL

> WRT the UV5R receiver, I thought I had read that the RX
> section was pretty good, with good sensitivity but not selectivity???

To be blunt, the UV-5R family of radios are infamous for terrible selectivity. You can just about forget using this radio within a mile or so of a paging transmission site or any sort of high powered commercial transmission site. Before getting any sort of base antenna to use with this radio I would take the radio up on the roof (or wherever you plan to have the base antenna) to see how it performs. If you get a lot of random crashes of static breaking through the squelch, you might not want a "better" antenna because the problem will only get worse with the increased signal strength.

From both a technical and performance standpoint, it is pretty much a toss up.

It sounds like a 10' mast from your deck would give you about the same height as a roof mount.

Unless you want to operate IN the next hurricane, a cast metal patio umbrella base will generally be adequate to hold 10' of mast and any of the antennas you have been looking at. Another alternative is a 5 gallon bucket filled with concrete with a length of pipe standing up in the concrete, then just slip the mast inside the pipe (make sure the mast will JUST fit inside the pipe before you build this contraption)

EXACTLY!

Just as you would think of Belden as a safe source of RG8 (although even they do make different quality grades of RG8), you can be confident of the quality of LMR-400 and other cable from Times Microwave. There are lots of other suppliers, some good, some bad, some so-so. If you have the opportunity, knowledge, and equipment to thoroughly test the cable, you don't need to stick with strictly name brand products -- otherwise, you usually get what you pay for.

What I, you or some one else defines as an emergency is unimportant. Only what the FCC defines as one is what counts.

Getting on that officers radio to report he's been shot might not be legal if you could have used cell phone. The same goes for the house fire, etc... The way I have heard it described is "if human life is in imminent danger of being lost and no other means of communication to save the persons life, than you'll probably be okay". Write it any way you want but here in the USA it's not what you or I think is right or wrong using a radio, only what the FCC says matters.

Gary N9PTC

  Technically, Gary, I don't think that's entirely true. Any individual, licensed or not, can legally use any radio or bands to communicate during an emergency situation.

You can, for example, use the officer's radio is his patrol car to call for help if he's shot and you won't have any issues with the FCC. The problem happens when some folks start to interpret what an actual "emergency" is.

Getting lost in the woods probably doesn't qualify in getting a free pass from the FCC, but if your home in the woods is on fire and you used a GMRS repeater to call for help the FCC probably wouldn't bust down your door for that. Of course, if you had a working telephone at your place you might have to explain why you choose to use the radio vs. the phone, but even then I doubt the FCC would grill you too much.

On Thu, Oct 24, 2013 at 9:41 PM, <n7kuw@n7kuw.com> wrote:
  Actually, there is no such thing in the U.S. as "license free". CB, FRS, MURS are all License By Rule (which is NOT the same thing as "license free". By rule, the FCC has granted license to all eligible people to operate on selected frequencies, providing they do so in compliance with the established regulations for those frequencies and the applicable radio service. Failure to operate in accordance with the applicable regulations is a violation of that license and subjects the violator to the possibility of penalty.

Part of the applicable rules very specifically state what equipment is and is not allowed for use on any particular radio service or set of frequencies. It is absolutely NOT true that "if the radio has the freqs it can be used". What YOU don't get is that there ARE regs/rules pertaining to EVERY SINGLE POSSIBLE RF EMISSION WITHIN THE BOUNDARIES COVERED BY THE FCC.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

True in spirit but not 100% exact. There are rules covering every possible RF emission in the United States, but those rules are not always FCC rules.

In the US, all RF 'from DC to Daylight' belongs to the NTIA -- they then pass along most of that spectrum to the FCC for regulation, the rest is regulated by the NTIA which covers _all_ federal government radio usage, including all federal government agencies and the military services.

Absolutely not true.

That is one of the myths that is constantly spread by hams who choose to deliberately misread 97.401 thru 97.405 (and of course by other incompetent hams who believe what others have told them). Note that 97.401 thru 97.405 apply only to an "amateur radio station." An amateur radio station is a licensed station operating in the Amateur Radio Service. Since the rules refer to the station, and not the operator, an unlicensed individual could legally use a ham radio in an actual emergency; but regardless of the license, no one is authorized to use that radio OUTSIDE the amateur radio service. The instant you tune your HT outside the ham band and transmit on a non-ham frequency you are NOT "an amateur radio station" you are simply a pirate station illegally operating in violation of the rules of whichever radio service is allocated the frequency you are using. Part 97 applies ONLY to the Amateur Radio Service, which means it legally applies only within the ham bands.

Several other radio services have their own specific "emergency" rules. For GMRS the rule is 95.143; for FRS the only applicable emergency rule is 95.193(d); for CB the rule is 95.418; for all Part 90 services there are NO special "emergency" rules. However all those services as well as most others are covered by Part 2, section 2.405

47 CFR 2.405 - OPERATION DURING EMERGENCY.
§ 2.405
Operation during emergency.
The licensee of any station (except amateur, standard broadcast, FM broadcast, noncommercial educational FM broadcast, or television broadcast) may, during a period of emergency in which normal communication facilities are disrupted as a result of hurricane, flood, earthquake, or similar disaster, utilize such station for emergency communication service in communicating in a manner other than that specified in the instrument of authorization: Provided:
. . .
(d) That in no event shall any station engage in emergency transmission on frequencies other than, or with power in excess of, that specified in the instrument of authorization or as otherwise expressly provided by the Commission, or by law

> You can, for example, use the officer's radio is his patrol car
> to call for help if he's shot and you won't have any issues with
> the FCC.

That much is true -- but it has nothing to do with it being an "emergency" -- the reason you won't have any issues with the FCC is because the FCC has no rules regulating who

transmits on that officer's public safety radio. There are no "operator" license requirements for ANY Part 90 radio service.

> Safety or even commercial radio frequencies.

Not quite true, Gary.

FRS - no license needed, but does need a certified FRS radio (which today generally means using only FRS channels 8-14)

Ham - requires an individual license, most flexible of all the radio services - also the most complex to use that flexibility effectively - the vast majority of tech class operators are clueless even about how to properly program and operate their own radio (much less anyone else's radio) (the same applies to some General and even a few Extra class operators)

GMRS - requires a license. The license covers all members of the named licensee's family (regardless of where they live). Repeaters are legal but relatively rare.

MURS - no license needed but does need a certified MURS radio. Relatively few certified radios are available.

Public Safety - no license needed for individual operators but they must have permission from the license holder and must use a Part 90 certified radio.

Commercial Radio - I assume you mean the other Part 90 services outside the Public Safety pool. Also no license needed for individual operators but they must have permission from the license holder and must use a Part 90 certified radio.

Not so much as a ground plane, but as a capacitor, Luke.

With a hand held, you, your body functions as a ground plane... well sort-a. That and like a big lossy capacitor to the earth.
The larger the surface area, the greater the capacitance, the better the coupling.

So it may just be a bit more than the placebo effect that you’re experiencing.

Stan

Subject: [baofeng_uv5r] Does the 3600mah battery improve ground?

I just received and installed the 3600mah battery on my UV-5R yesterday and it seems to me that the TX/RX performance is slightly better on a few of the repeaters in my area that generally have marginal reception. It occurred to me that the larger battery might be providing a larger ground plane, therefore improving performance, but I have no real way to prove/disprove this theory. After all it could simply be my imagination but I definitely thought a few repeaters sounded better with the larger battery installed. On another note, the larger battery really gives you a better grip when you're walking around with the radio, and makes it easier to manage buttons on the keypad if you have big hands like I do. Would love to hear any thoughts or findings with the 3600mah battery from anybody else.

Hi

I live in Ottawa Canada a few days ago the was a software glitch with the Rogers network .

It made all the cell phones in the area expensive Pack-Man Toys but not of much use for their primary function as a phone.

However most just kept reading the same old text messages to justify the cost.

This was not even a hardware issue.

My Ham radios worked perfectly.

Should this had been a real emergency lives could have been lost.

I don’t have a cell phone and will not get one, I prefer to have control of my life not have it dictated to me by the Rogers\Shaws of the cell phone world.

You can't hear them, but they can hear you. Just like using a CB with an external amplifier. It accomplishes nothing and hurts a lot.

So the rules were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.

But, if someone in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency communications system they designed and implemented.

Those are the reasons behind these particular rules. There are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher

power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

I think it's great that so many Hams offer their communications ability in emergency situations, but I'm have a hard time understanding the need, or "fit". I'm a volunteer first responder as a PA Fire Police Officer in a rural area. All of our Fire Police Officers, all line officers, all command officers, already have department issued radios, as do all of our apparatus (vehicles) and the state police. Communications are county wide via repeaters with our county emergency services center. I just don't see how there would be a need for Amateurs in our situation, but what am I missing? Is this not the same in the rest fo the country, meaning your First Responders are not radio equipped?

Carl,

I pity your area if
your CERT team is actually trying to use 1/2 watt FRS radios as their main
communication system. Surely somebody there has explained that a Tech
license is so easy to get now there really is no valid excuse anymore to
not have it, haven't they?

If there is ever a large tsunami that hits the
northwest (and I pray that doesn't happen), those FRS radios will be as
worthless as cell phones on 9/11 in New York City.

On Tue, Oct 22, 2013
at 9:44 PM, wrote:

Very good answer by John Bee N1GNV. However, the 20
mile example should be more like 20 blocks. FRS is really intended as a
VERY short range service. As soon as you enable the ability to get more
range, you now have the absolute likelihood of causing harmful interference
with other FRS users who are not using higher power or external antennas.
You can't hear them, but they can hear you. Just like using a CB with an
external amplifier. It accomplishes nothing and hurts a lot.

So the rules
were designed to intentionally prevent increasing the FRS range. A
practical example: The county to my north has a very comprehensive CERT
program (Community Emergency Response Team). They have divided the county
into various sectors, and each sector is assigned an FRS frequency for
their teams to use within that sector. Because of the intentional limited
range, they can re-use frequencies a second county away without the teams
interfering with each other. That way they can serve 30 some sectors with
only 14 FRS channels and have no interference problems.

But, if someone
in one of those sectors decides they are going to use the UV-5R with a gain
antenna and 4 watts of power out, now they would interfere with the
communications two sectors over (possibly in multiple directions) and
degrade the overall emergency communications system they designed and
implemented.

Those are the reasons behind these particular rules. There
are many other licensed radio services available (ham, GMRS,

commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

wrote:

>>I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

I'm not an
FCC lawyer, nor do I play one on TV, but…

I believe the FRS was conceived
as a local, "keep in touch with friends", non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We'll never hear each other, and so we can share the frequency with no problem. As a Ham, I'm always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they're effectively limiting my range.

I think the FCC learned from the CB
service. Just like Ham Radio, the available equipment lends itself easily to "enhancement", legal or otherwise. It's become virtually impossible to enforce regulations in all but the most egregious cases. It's much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

If I install the antenna on the deck, I was thinking of just getting it up about 6-7 ft so that if I am not using it, I can just bring it inside. 10 ft would be too cumbersome.

This leads me to the next question, and this is about Grounding........
My potential install on the deck , where I install it only when its in use would be done so that I do not have to worry about grounding for the time being. If I have the antenna on the 3 or 2nd floor, and my radio is nearby, then I just run the cable to the area where I will operate the radio indoors, which will be about 20-30 ft of cable. Doing this short run assumes a direct run from the antenna to the radio, with no run of wire to the ground for Grounding.....If there were a safe way to protect the antenna from lightning, etc, thats easy, I would like to hear about it.

T

Unless you want to operate IN the next hurricane, a cast metal patio
umbrella base will generally be adequate to hold 10' of mast and any of the
antennas you have been looking at. Another alternative is a 5 gallon bucket
filled with concrete with a length of pipe standing up in the concrete, then
just slip the mast inside the pipe (make sure the mast will JUST fit inside
the pipe before you build this contraption)

When your entire radio system is rendered inoperable during the next major solar storm (including all your handhelds that were turned on when it happens) and the only ones operating are hams on battery/solar power come back and talk to me.

Also…the hams perform a different function during emergencies like below allowing the people to communicate to emergency officials and not emergency officials talking to themselves.
So while the police are busy handling calls the hams are relaying requests to obtain needed services…many times in conjunctions with the Red Cross…for both emergency services, support services, and messages to friends and family.

Depending on the severity of the solar event that WILL happen comm will be degraded in varying degrees.

Just read about the 1859 Carrington event…before most electronics were even invented.

http://en.wikipedia.org/wiki/Solar_storm_of_1859

Oh yeah…and your backup generator for your 911 center that runs off of natural gas won't be working either because the natural gas controls will all be offline too.

So…no electricity…no natural gas…and people draining the gas tanks around town with manual pumps until they are dry in short order so no gasoline for long either.

The outage is likely to last one heck of long time….as they will have to replace most all the transformers on the electrical grid and that will be a very slow process.

The good news is I do believe it should only fry about half the world that's pointing towards the sun when it happens.

Jim,

You're not seeing it. We don't replace ; we support as needed, not just first response units but any agency that needs communications under emergency conditions. Also, as crazy as it may sound, sometimes police and fire communication systems do fail and that is when we would be called upon to assist.

Topic: 35842 Message: 35846

Might I add to this discussion... I suggest Jim
might take a couple minutes reading
here... http://en.wikipedia.org/wiki/Amateur_Radio_Emergency_Service
which, of course, is just the tip of the iceberg so to speak.
ARES trains to be of useful service when disaster
strikes, and when other communications are either
failed, or overloaded. We handle traffic of less
importance to the operating entities, and
sometimes pick up for them if/when they fail for whatever reason.
Anyway... the wikipedia link does touch on the
functions, memorandums of understanding etc etc...
Enjoy
Bob

Thank you everyone for the additional insight. I will say though that Amateur equipment will be just as vulnerable to EMF as ours, given the same level of shielding of course.

When your entire radio system is rendered inoperable during the next major solar storm (including all your handhelds that were turned on when it happens) and the only ones operating are hams on battery/solar power come back and talk to me.

Also…the hams perform a different function during emergencies like below allowing the people to communicate to emergency officials and not emergency officials talking to themselves.
So while the police are busy handling calls the hams are relaying requests to obtain needed services…many times in conjunctions with the Red Cross…for both emergency services, support services, and messages to friends and family.

Depending on the severity of the solar event that WILL happen comm will be degraded in varying degrees.

Just read about the 1859 Carrington event…before most electronics were even invented.

http://en.wikipedia.org/wiki/Solar_storm_of_1859 [1]

Oh yeah…and your backup generator for your 911 center that runs off of natural gas won't be working either because the natural gas controls will all be offline too.

So…no electricity…no natural gas…and people draining the gas tanks around town with manual pumps until they are dry in short order so no gasoline for long either.

The outage is likely to last one heck of long time….as they will have to replace most all the transformers on the electrical grid and that will be a very slow process.

The good news is I do believe it should only fry about half the world that's pointing towards the sun when it

happens.

Understanding the FRS issue

I think it's great that so many Hams offer
their communications ability in emergency situations, but I'm have a hard
time understanding the need, or "fit". I'm a volunteer first responder as a
PA Fire Police Officer in a rural area. All of our Fire Police Officers,
all line officers, all command officers, already have department issued
radios, as do all of our apparatus (vehicles) and the state police.
Communications are county wide via repeaters with our county emergency
services center. I just don't see how there would be a need for Amateurs in
our situation, but what am I missing? Is this not the same in the rest fo
the country, meaning your First Responders are not radio equipped?

Never forget our Brother ">

Carl,

I pity your area if your
CERT team is actually trying to use 1/2 watt FRS radios as their main
communication system. Surely somebody there has explained that a Tech
license is so easy to get now there really is no valid excuse anymore to
not have it, haven't they?

If there is ever a large tsunami that hits the
northwest (and I pray that doesn't happen), those FRS radios will be as
worthless as cell phones on 9/11 in New York City.

On Tue, Oct 22, 2013 at
9:44 PM, wrote:

Very good answer by John Bee N1GNV. However, the 20
mile example should be more like 20 blocks. FRS is really intended as a
VERY short range service. As soon as you enable the ability to get more
range, you now have the absolute likelihood of causing harmful interference
with other FRS users who are not using higher power or external antennas.
You can't hear them, but they can hear you. Just like using a CB with an
external amplifier. It accomplishes nothing and hurts a lot.

So the rules
were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.

But, if someone
in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency communications system they designed and implemented.

Those are the reasons behind these particular rules. There
are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

wrote:

>>I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

I'm not an
FCC lawyer, nor do I play one on TV, but…

I believe the FRS was conceived
as a local, "keep in touch with friends", non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We'll never hear each other, and so we can share the frequency with no problem. As a Ham, I'm always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they're effectively limiting my range.

I think the FCC learned from the CB
service. Just like Ham Radio, the available equipment lends itself easily to "enhancement", legal or otherwise. It's become virtually impossible to enforce regulations in all but the most egregious cases. It's much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

Not if it’s not turned on and not plugged in. That’s how you ensure you survive any power surges and solar storm possibilities.

I think even the power surge outlets or UPS’s will help but don’t quote me on that one…but they are designed for such things. There’s a lack of real-world testing of major solar storms thankfully J

Plus many hams have backup capability in their cars for example that will survive.

If there is ever a large tsunami that hits the northwest (and I pray that doesn't happen), those FRS radios will be as worthless as cell phones on 9/11 in New York City.

On Tue, Oct 22, 2013 at 9:44 PM, <n7kuw@...> wrote:

Very good answer by John Bee N1GNV. However, the 20 mile example should be more like 20 blocks. FRS is really intended as a VERY short range service. As soon as you enable the ability to get more range, you now have the absolute likelihood of causing harmful interference with other FRS users who are not using higher power or external antennas. You can't hear them, but they can hear you. Just like using a CB with an external amplifier. It accomplishes nothing and hurts a lot.

So the rules were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.

But, if someone in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency communications system they designed and implemented.

Those are the reasons behind these particular rules. There are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

>>I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

I’m not an FCC lawyer, nor do I play one on TV, but…

I believe the FRS was conceived as a local, “keep in touch with friends”, non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We’ll never hear each other, and so we can share the frequency with no problem. As a Ham, I’m always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they’re effectively limiting my range.

I think the FCC learned from the CB service. Just like Ham Radio, the available equipment lends itself easily to “enhancement”, legal or otherwise. It’s become virtually impossible to enforce regulations in all but the most egregious cases. It’s much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

Thanks and 73,

John Bee N1GNV

Jim. I don't think think you see the picture here. I do believe all three, the officer, first responder, and volunteer fire person have radios. The people in Hannibal who needed to call 911 could more easily find one of the 45 ham radio club members to place the 911 call for them, than to find these three very busy people. (very small town Missouri, not New York)

Topic: 35698 Message: 35852

You're correct there are degrees of damage and Faraday cage is probably the best solution for the worst case.

Almost nobody has a metal garbage can anymore so can't throw stuff in there.

And with 15 minutes warning there's not a lot of time if it's a really big one.

The power grid surge is the first to happen as it's one huge antenna. Then plugged in units.then turned on units..the turned off units..

Having a small foil shielded box around that you throw your handheld, cell phone, and keep your emergency radios in is the cheapest solution that will leave you with some ability if the storm is that severe.

Probably a good excuse to have a couple spare UV5R's around sitting in that box. The batteries will be OK outside so you keep a set charged and use solar to recharge.

I think CMOS circuits are particularly susceptible too but there are fewer of those around in todays radios.

My understanding is that if it is electronic, and not inside a Faraday shield, it will not matter if the device is on or off, or plugged in or not. Even a car in a garage, not running, will be disabled unless it's an older vehicle pre electronic ignition.
Or so I have read.

Not if it?s not turned on and not plugged in. That?s how you ensure you survive any power surges and solar storm possibilities.

I think even the power surge outlets or UPS?s will help but don?t quote me on that one?but they are designed for such things. There?s a lack of real-world testing of major solar storms thankfully J

Plus many hams have backup capability in their cars for example that will survive.

Thank you everyone for the additional insight. I will say though that Amateur equipment will be just as vulnerable to EMF as ours, given the same level of shielding of course.

On Fri, 25 Oct 2013 10:48:06 -0500, "Michael Black" <mdblack98@...> wrote:

When your entire radio system is rendered inoperable during the next major solar storm (including all your handhelds that were turned on when it happens) and the only ones operating are hams on battery/solar power come back and talk to me.

Also?the hams perform a different function during emergencies like below allowing the people to communicate to emergency officials and not emergency officials talking to themselves.
So while the police are busy handling calls the hams are relaying requests to obtain needed services?many times in conjunctions with the Red Cross?for both emergency services, support services, and messages to friends and family.

Depending on the severity of the solar event that WILL happen comm will be degraded in varying degrees.

Just read about the 1859 Carrington event?before most electronics were even invented.

http://en.wikipedia.org/wiki/Solar_storm_of_1859

Oh yeah?and your backup generator for your 911 center that runs off of natural gas won?t be working either because the natural gas controls will all be offline too.

So?no electricity?no natural gas?and people draining the gas tanks around town with manual pumps until they are dry in short order so no gasoline for long either.

The outage is likely to last one heck of long time?.as they will have to replace most all the transformers on the electrical grid and that will be a very slow process.

The good news is I do believe it should only fry about half the world that?s pointing towards the sun when it happens.

I believe the FRS was conceived as a local, ?keep in touch with friends?, non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6.

We?ll never hear each other, and so we can share the frequency with no problem. As a Ham, I?m always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they?re effectively limiting my range.

I think the FCC learned from the CB service. Just like Ham Radio, the available equipment lends itself easily to ?enhancement?, legal or otherwise. It?s become virtually impossible to enforce regulations in all but the most egregious cases. It?s much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

Thanks and 73,

John Bee N1GNV

Can't be done. The SCAN_ADD setting can only be changed using software.

That is a good antenna. There are many equally good, but this one is fine.
It should do what you want and should last for many years.

> WRT connections, its got an SO 239, not an N connector as
> is normally suggested for UHF (yes, I remembered that
> from my Tech test). Does anyone know if they will supply
> that antenna with an N connector????

I don't see that option mentioned on their website, but it certainly
wouldn't hurt to contact them and ask. Many small antenna makers will
provide a different connector for a small extra charge. If you really want
an N connector and Arrow won't supply their antenna with one, you can find
similar antennas from several other companies.

The N connector -- including any of the connectors in its family (such as
BNC and TNC) -- is a somewhat better choice that the SO-238/PL-259
combination at UHF, but that difference is hardly overwhelming. And
choosing an N Connector requires a bit of care.

The problem with the SO-238/PL-259 is that this is nominally a "50 ohm"
connector but inherent impedance of the connector drops to around 40 ohms
(or even a little less) for about 1cm where the connectors come together.
This small impedance mismatch can cause some reflected power on the
feedline, recognizable as a slight increase in SWR.

The design of ALL the N connectors provided a more uniform diameter and
therefore a more uniform impedance throughout the connection which nearly
eliminates the impedance bump and should give a slightly better SWR.

Despite the name "UHF Connector" for the SO-238/PL-259, these connectors
were never designed for use above 300 MHz. The fact that they do work
adequately well past 300 MHz is amply demonstrated by the fact that nearly
all ham and commercial radios operating below 500 MHz come from the factory
with these connectors. The misnamed "UHF" connector comes only in a nominal
50 ohm impedance and should not be used with 75 ohm cable.

On the other hand, the N Connectors come in both 50 ohm and 75 ohm versions.
If you are getting the connector from a reliable source you should get the
impedance you asked for; but shopping for N connectors at a hamfest flea
market or from any sort of surplus or discount source is a bit risky. The
center pin of a 50 ohm N connector is thicker than the center pin of a 75

ohm connector but spotting the difference by eye pretty much requires having at least one positively known connector to use for comparison.

Wikipedia has a decent explanation of the issues involved: "The N connector follows the MIL-C-39012 standard, defined by the US military, and comes in 50 and 75 ohm versions. The 50 ohm version is widely used in the infrastructure of land mobile, wireless data, paging and cellular systems. The 75 ohm version is primarily used in the infrastructure of cable television systems. Connecting these two different types of connectors to each other can lead to damage due to the difference in diameter of the center pin. Unfortunately, many type N connectors are not labeled, and it can be difficult to prevent this situation in a mixed impedance environment. The situation is further complicated by some makers of 75 ohm sockets designing them with enough spring yield to accept the larger 50 ohm pin without irreversible damage, while others clearly do not, and expect users to segregate their connectors and adaptors. In general a 50 ohm socket is not damaged by a 75 ohm pin, but the loose fit means the contact quality is not guaranteed." And, of course, beyond the mechanical issues, using a 75 ohm N connector with 50 ohm coax and a 50 ohm antenna would defeat the entire purpose of using an N connector at all.

By the way, I will mention that the N connector family are not the only connectors that avoid the impedance bump and work well at UHF and even SHF. Another family of connectors that also offer a constant diameter and constant impedance are the SMA connectors (such as the one used on the radio). SMA connectors are 50 ohm, but can develop some mismatch over time if the connector is repeatedly connected and disconnected without being properly torqued.

From: Doug McClure

> I know a guy that passed both Tech and General
> in the same day and has no clue how to program
> or operate.

Sadly, it is almost certainly not his fault.

Between the FCC and the ARRL both looking to keep expanding the number of licensed amateurs and the overall drive in this country to dumb-down any and all "tests", we have a situation where the written tests for the various levels of ham license do not - and CANNOT - cover the knowledge that a new ham needs to be a good operator.

Part of the shortfall is certainly in technical knowledge -- knowledge and understanding that 20-30 years ago were taken for granted in a Tech class operator today are not a sure thing even among Extra class operators. ALL we can be sure of today is that a new ham knew the answers to a set of specific test questions -- and really only that he knew them on the day of the test.

The difference is NOT JUST that the written tests are easier than ever before. The real difference that is killing amateur radio in the US, is that we have nearly run out of Elmers. For the sake of the hams first licensed in this century, let me explain that "Elmer" is the term for an experienced ham who helps a new comer get started in amateur radio.

Many of us remember the arguments for and against dropping the Morse Code requirement for a ham license. Most of the arguments on both side of that debate were emotional rather than logical. The simple fact is that there had not really been a need for hams to know Morse Code in many years. But at the same time, eliminating the Morse Code requirement, without replacing it with something else, was largely responsible for the sad state of ham radio today.

Morse Code itself was not really a valuable skill - but the requirement to learn it almost always forced prospective new hams to get training and assistance from experienced hams. Learning Morse Code took a typical applicant 2-3 months of practice that centered around weekly training sessions. Those weekly training sessions brought the student into contact with experienced hams who had already demonstrated a willingness to help him learn. In the vast majority of cases, friendships developed between the students and teachers as well as among the students. More to the point, the students learned far more than just Morse Code -- they also learned what constituted "Good Amateur Practice" - i.e. what kinds of on-the-air behavior were acceptable and unacceptable. By the time they got a license, these new hams had ham friends who helped them select their first radio (often a used

rig bought at low cost from one of those friends) and who helped them learn to operate their first radio.

Now there is no need for anyone to teach prospective new hams -- all the new comer does is logon to some website and run through the practice test a few times -- there isn't a need - or even any reason - to actually learn the subjects supposedly covered by the test -- instead all the student learns is the specific answer to each specific question. This is like teaching children in primary school that Two Plus Two Equals Four and then giving them a certificate that says they know how to add!

Shh, don't tell Xuan that ham radio was the only thing that worked - he still thinks FRS bubble pack radios given out to CERT folks that can't pass a Tech license will save the day, going house to house with radios that have a range of a few hundred yards.

> First Responders are not radio equipped?

OK, Jim, let me take that question a bit at a time.

You describe a situation that would be unusual at best -- and to be blunt, I don't quite believe you.

You are telling me that every State Police Car in all of Pennsylvania comes equipped with both a mobile and a handheld radio programmed with the frequency and code for your small rural fire department? And, of course, that the police in your town, and the County Sheriff's officers, and the adjacent town police and fire departments ALL operate on the same radio channel?? And that each of those responders also has a radio that simultaneously lets them monitor and talk to the Red Cross on 47.420 MHz as well as the County Works Department, the State Highway Department, your local RECC repair trucks, etc.?

No, I don't suppose you really meant that, did you?

Your fire department can talk to everyone they care to talk to while fighting a routine structure fire or perhaps even a small field fire. But what happens when it is SHTF time? What happens when all those Mutual Aid Agreements are called in and you have police and fire fighters from several different departments all working in the same area? What happens when school busses are being used to evacuate people downwind of a hazmat incident?

Emergency Communications Volunteers (hams or otherwise) are not typically needed in routine operations - or even minor "emergencies" -- but when a major disaster strikes, especially if it strikes a wide area, the same communications systems that "work fine" for routine use are almost always

inadequate. The federal government has poured BILLIONS of dollars in federal grants into getting states and large cities to develop "interoperable" communications systems; but it is still very rare that any of those systems have the spare capacity to handle double or triple the amount of radio traffic.

Go by your county EMA office and ask about their NDMS plan or any of the other That-Will-Never-Happen-Here plans that are filed away in the binders.

The simple fact is that NO government can afford to develop and deploy a radio communications system with the capacity to handle a major disaster because doing so costs too much money and requires too much training for everyone who will need to operate it. Emergency Communications Volunteers are a nearly zero cost way to have the extra capacity that might only be needed once in a decade or even once in a century. Would you choose to live in the "Hundred Year Flood Plain" without flood insurance, secure in the knowledge that your house will only get washed away an average of once per century?

There is a reasonable chance that you might live your entire life in your town and never need any sort of communications that you don't already have - but how may lives are you willing to bet on that?

That depends on both the design of the equipment and the strength of the electromagnetic pulse.

If we get hit with a strong enough EMP or solar flare, the entire planet could be back in the 18th century.

On the other hand, our electronic devices are subjected to minor EMP events almost every day. Do you wear and electronic watch? Have you ever walked across a carpet or worn a wool sweater and been shocked by static electricity? Your watch was subjected to a minor EMP event when that charge flowed from your body to the ground, but it probably did not fry your watch.

Xuan, I have made some rather unique posts but you sir, ARE JUST PLAIN OUT OF LINE HERE!

This is why this baofeng group sucks, people like you who DON'T KNOW Jack crap about emergency comms at all.

I hate to tell you but it's 100% TRUTH. ALL agencies WILL call upon Hams to help when all other means fail.

This USE a cell phone mentailty that most of you have will probably KILL somebody in an emergency situation.

Your post is exactly why encryption IS needed on the ham bands. I know for fact that when main radio systems and their backups are down and cell towers are down that amateurs will be called upon as a SHTF force.

Most of you don't even know the real meaning of the hipaa act.

I suggest that you take another CERT course or just give up your amateur license.

No wonder Radio reference and this group went to shit, it's because of wanna be know it alls like your sorry ass.

EMR, you, like alot of dumbasses, rely on that damn cell phone too much.

when SHTF and there is no cell phones or PS radio systems, Amatuer radio
will play a big role whether you people like it or not. It's time you
people reducated yourselves and started listening to preppers.

35873. Antenna testing....strange results

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-25 21:00:30 UTC
From: <toshutrinity@...>
Topic: 35873 Message: 35873

I have been following a lot of good discussions here, especially about antennas. As a result, shortly after I got my radio, I started to buy and test different aftermarket antennas for the UV5R.

So far I have tested a Smiley 270a and a "Diamond RH771" without much improvement (in my circumstances) as compared to the stock Baofeng antennas (I have access to 2 different ones since I bought one radio from Kurt and my friend ordered one off of ebay, and I am playing with it as well)

Well, the other day I got the "Harvest RH660S"......based on comments by Mike here in the group, it is probably a counterfeit.....but....the results I got with it are Strange....

With the 660 antenna, I am able to hit repeaters that are about 30 miles inland,west of me. ....thats great since thats the first time I have been able to do that ....however....I cannot hear them using that radio with the 660 antenna. !!! The second Baofeng radio I have, with a stock antenna, can pick up my hitting the repeater and the replies I get to my conversation!!??

So, in other words, I was able to have a conversation over this repeater 30 miles away by using 2 radios. I used the 660S antenna radio to transmit, and I heard/received on the second radio with the stock antenna....Heck, I dont even here the repeater Kerchunk when I end transmission on the 660S radio...Yes, I tried swapping antennas on the radio, and the same thing happened. Yes, I check CHIRP and the 2 different repeaters I tried this on were properly set for Duplex.....

So..... any thought or comments????

T

Hi Toshu:

It does appear that one of your transceivers is having a reception problem. But, to properly confirm that, you'd need some serious test gear.
For a transceiver as inexpensive as the UV-5R is, it's probably not worth the effort to try to pay someone to investigate or repair it.
If the unit is still under warranty, maybe you could get a replacement. Failing that, order a new one.

I haven't been on this list very long and I haven't posted yet but this crap is getting out of control. There is so much ego and plain ignorance. If you don't know then ask. Otherwise shut up.

I'm currently a Paramedic and have been in EMS for over 20+ years. Let me tell you that when SHTF these commercial systems are going to be useless in time if not immediately. Why? Overload. Too many chiefs and not enough Indians. I see it now with a "normal" day. People have diarrhea of the mouth. Freqs will be locked up with unnecessary traffic.

Not to mention that people do not even know about ruthless preemption when it comes to cell phones. Never heard about? Google or Bing or yahoo it. Every cell phone is pre programmed and you won't know what priority you will get. You could be lucky and have a high one and thus no problems. Or a low one and your cell is useless for voice until the network is freed up some.

Now the bickering over frs and gmrs and ham and which is better is just dumb. In emergency situations you use what you have to get the job done. As a ham you can go out of your licensed bands to pass traffic etc. during that emergency.

Hams practice traffic handling all of the time. They are prepared for it and it takes practice to do it properly and efficiently.

And in closing.. this is a list about a radio. Not about the best bands for SHTF. There are other places for that type of bickering.

35877. Re: [baofeng_uv5r] Understanding Emergency Communications Volunteers

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-25 21:21:33 UTC
From: John R. Strohm
Topic: 35842 Message: 35877

Emmett, I think you maybe need to sit down, breathe slowly for about ten minutes, and then re-read what Xuan wrote.

You and he are ON THE SAME SIDE in this discussion.

Jim Henry came on asking why any local outfit would ever ask, or want, Ham help.

Xuan pointed out that, in a major emergency, the local outfits will be augmented by out-of-town outfits, and almost none of their communications gear is interoperable. He pointed out some other things, as well.

The problem is that he never really came right out and said “That’s why, when a major SHTF happens, amateurs WILL be asked to help.”

From: Emmett Gulley
Sent: Friday, October 25, 2013 3:39 PM
To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Understanding Emergency Communications Volunteers

Xuan, I have made some rather unique posts but you sir, ARE JUST PLAIN OUT OF LINE HERE!

This is why this baofeng group sucks, people like you who DON'T KNOW Jack crap about emergency comms at all.

I hate to tell you but it's 100% TRUTH. ALL agencies WILL call upon Hams to help when all other means fail.

This USE a cell phone mentailty that most of you have will probably KILL somebody in an emergency situation.

Your post is exactly why encryption IS needed on the ham bands. I know for fact that when main radio systems and their backups are down and cell towers are down that amateurs will be called upon as a SHTF force.

Most of you don't even know the real meaning of the hipaa act.

I suggest that you take another CERT course or just give up your amateur license.

No wonder Radio reference and this group went to shit, it's because of wanna be know it alls like your sorry ass.

OK, Jim, let me take that question a bit at a time.

You describe a situation that would be unusual at best -- and to be blunt, I don't quite believe you.

You are telling me that every State Police Car in all of Pennsylvania comes equipped with both a mobile and a handheld radio programmed with the frequency and code for your small rural fire department? And, of course, that the police in your town, and the County Sheriff's officers, and the adjacent town police and fire departments ALL operate on the same radio channel?? And that each of those responders also has a radio that simultaneously lets them monitor and talk to the Red Cross on 47.420 MHz as well as the County Works Department, the State Highway Department, your local RECC repair trucks, etc.?

No, I don't suppose you really meant that, did you?

Your fire department can talk to everyone they care to talk to while fighting a routine structure fire or perhaps even a small field fire. But what happens when it is SHTF time? What happens when all those Mutual Aid Agreements are called in and you have police and fire fighters from several different departments all working in the same area? What happens when school busses are being used to evacuate people downwind of a hazmat incident?

Emergency Communications Volunteers (hams or otherwise) are not typically needed in routine operations - or even minor "emergencies" -- but when a major disaster strikes, especially if it strikes a wide area, the same communications systems that "work fine" for routine use are almost always inadequate. The federal government has poured BILLIONS of dollars in federal grants into getting states and large cities to develop "interoperable" communications systems; but it is still very rare that any of those systems have the spare capacity to handle double or triple the amount of radio traffic.

Go by your county EMA office and ask about their NDMS plan or any of the other That-Will-Never-Happen-Here plans that are filed away in the binders.

The simple fact is that NO government can afford to develop and deploy a radio communications system with the capacity to handle a major disaster

because doing so costs too much money and requires too much training for everyone who will need to operate it. Emergency Communications Volunteers are a nearly zero cost way to have the extra capacity that might only be needed once in a decade or even once in a century. Would you choose to live in the "Hundred Year Flood Plain" without flood insurance, secure in the knowledge that your house will only get washed away an average of once per century?

There is a reasonable chance that you might live your entire life in your town and never need any sort of communications that you don't already have - but how may lives are you willing to bet on that?

Ray

I do not think that is the problem since I swapped antennas and tried again with the same result!!! I am able to hit repeaters about 20 miles away with the stock antenna with both radios I am testing.

On Friday, October 25, 2013 5:14 PM, Ray Sills <raysills3@...> wrote:

It is pretty simple. And very common with these radios. The added gain causes the radio to go deaf because of its poor selectivity. The radio's receiver is being swamped by strong out-of-band signals.

If you can, borrow some antennas from other hams and try them out and see which one you like best.

Bear in mind that there's no such thing as a "GAIN" antenna! You can't get something from nothing!

It's ALL about the radiation pattern and how much of your transmitted signal is focused towards the horizon.

Also, the higher the "gain" factor of an antenna, the less bandwidth you will be able to use it on!

Just my 2 cents!

Rod

Topic: 35842 Message: 35882

I would like to add my 14.5 cents (inflation) and use a very specific example that can be verified if you have a November 2002 copy of QST. In 2002 the NE section of Arizona was afflicted with 2 small wildland fires. One was the Rodeo Fire and the other was the Chediski Fire, they later combined and burned a little over 1/2 millions acres of land. When the fire people realized what a mess they had on their hands the phone trees were activates. Red Cross, Salvation Army, Ham Radio. The hams were used to man shelters and maintain communications with the Red Cross Disaster Command Post in Phoenix AZ, about 200 miles away using some of the repeaters that were linked together. I had a shelter supervisor ask me about contacting Phoenix just as Phoenix RC called me. We copied he inbound messages and then I was able to send the 2 requests she had to the CP. She thought I walked on water because it was so easy to get the messages through. There were never enough volunteers to handle all of the types of problems that pop up, The number of radio freqs. that were being use was absurd, but can you imagine me trying to contact the RC on one of the PD freqs, when there might be a evacuation going on using that freq? They wouldn't be walking all over me or vice versa. This is why hams are called. I worked for close to two weeks in 3 different locations on sometimes a 12 hour shift, but I won't complain about it. And once in a while I bump into one of the FD or PD that was working the fire and get a Thank You from them. Trust me, it is returned right away.
If you want to read it you can find it here:

Indeed sir... that is one of the often overlooked approaches to dead air!
A careful attack, using the East coast, the West Coast, and the Gulf
to coordinate such attacks, would/could make things downright nasty
for everything except maybe the mid northern states. Having some
shielded electronics stashed away is perhaps a very wise move....as
well as other items of survival...
Sooner, rather than later, might be the time to do so.

Careful, Ed, you're blowing up Xuan's idea that FRS radios are the perfect fit for disasters like Rodeo-Chedeski.

BTW, do they still have the sign up in Heber or Overguard thanking the nature nuts for helping burn 500,000 acres of forest by not allowing any thinning during the previous 20+ years with all their lawsuits?

Nicely done sir! An excellent example of what Amateur Radio does in such situations... the "pros" are up to their eyeballs with other radio traffic, and hams can handle much if not all of the other important but not necessarily priority traffic.

The FRS radios are for close by conversations only, not over 1/2 mile. We have used them in the past with our SAR team to communicate amongst ourselves, about 300 yards or less, before we got into ham. This way, we would not interfere with any OPS freqs. FRS was NEVER designed for anything more than close by.

I haven't read this entire thread, nor do I have the time, but when it comes to Emergency Communications, at least in Oregon, the Amateur Radio operators are relied upon VERY HEAVILY!

I'm the radio tech for our County and in EVERY exercise, Amateur Radio operators are utilized! Maybe not as often as they would like, but believe me, they WILL get the communications and messages through LONG before any Public Safety service can!

Commercial communications equipment is STUCK with the frequencies its programmed for! You can't just change the frequency because that channel is busy! And believe me, they pile up QUICKLY!

Most Emergency Management and Public Safety agencies, at least in our area, are "sold" on the 800 MHz trunking system. DUMB frequencies to put ANY voice communications system on!

It's strictly line-of-sight and requires a MASSIVE amount of money and equipment to even "MAKE" it work.

Not to mention most of it is Motorola (You might find better, but you won't pay more)!

But, as for Hams in Emergency Comm: BRAVO!!! Keep 'em comin'!

Craig, I think someone took it down a couple of years ago. But there are still acres of burned trees alongside the road that have not been cut down. Makes me feel sad everytime I go through.

FRS is a tool that CAN be used in any emergency, BUT and here's the kicker: if your people aren't trained in how to use them and properly communicate with them, especially in an emergency situation, then they will be like ANY other radio system: useless!

Careful, Ed, you're blowing up
Xuan's idea that FRS radios are the perfect fit for
disasters like Rodeo-Chedeski.

BTW, do they still have the sign up in Heber or
Overguard thanking the nature nuts for helping burn 500,000
acres of forest by not allowing any thinning during the
previous 20+ years with all their lawsuits?

Xuan, I have made some rather unique posts but you sir,
ARE JUST PLAIN OUT
OF LINE HERE!

This is
why this baofeng group sucks, people like you
who DON'T KNOW Jack crap about emergency comms at all.

I hate to
tell you but it's 100% TRUTH. ALL agencies WILL call
upon Hams to help when all
other means fail.

This USE a cell phone mentailty that most of you
have will probably KILL somebody in an emergency situation.

Your
post is exactly why encryption IS needed on the ham bands. I know for fact that
when main radio systems and their backups are down and cell towers are down that
amateurs will be called upon as a SHTF force.

Most of you don't
even know the real meaning of the hipaa act.

I suggest that you
take another CERT course or just give up your amateur license.

No
wonder Radio reference and this group went to shit, it's
because of wanna be
know it alls like your sorry ass.

how there would be a need for
Amateurs
> in our situation, but what
am I missing? Is this not
>
the same in the rest of the country, meaning your
> First Responders are
not radio equipped?

OK,
Jim, let me take that question a bit at a
time.

You describe a
situation that would be unusual at best -- and to
be blunt, I
don't quite believe
you.

You are telling me
that every
State Police Car in all of Pennsylvania comes
equipped with both a mobile
and a handheld radio programmed with the
frequency and code for your small
rural fire department? And, of course,
that the police in your town, and
the County Sheriff's officers, and the
adjacent town police and fire
departments ALL operate on the same radio
channel?? And that each of those
responders also has a radio that
simultaneously lets them monitor and talk
to the Red Cross on 47.420 MHz as
well as
the County Works Department, the
State Highway Department, your
local RECC
repair trucks, etc.?

No,
I don't suppose you really meant that, did you?

Your fire department
can talk to everyone they care to talk to while
fighting a routine
structure fire or perhaps even a small field fire. But
what happens when
it is SHTF time? What happens when all those Mutual Aid

Agreements are
called in and you have police and fire fighters from
several
different
departments all working in the same area? What happens
when
school busses
are being used to evacuate people downwind of a hazmat

incident?

Emergency Communications Volunteers (hams or
otherwise)
are not typically
needed in routine
operations - or even minor
"emergencies" -- but when a
major disaster strikes, especially if it
strikes a wide area, the same
communications systems that "work
fine" for

routine use are almost always
inadequate.
The federal government has
poured BILLIONS of dollars in
federal
grants into getting states and large
cities to develop
"interoperable" communications
systems; but it is still
very rare that any
of those systems have
the spare capacity to handle
double or triple the
amount of radio
traffic.

Go by your county
EMA
office and ask about their NDMS plan or any of the
other
That-Will-Never-Happen-Here plans that are filed away in
the
binders.

The simple fact
is that NO government can afford to develop
and deploy a
radio communications system
with the capacity to handle a
major disaster
because doing so costs too
much money and requires too much
training for
everyone who will need to
operate it. Emergency
Communications Volunteers
are a nearly
zero cost way to have the extra
capacity that might only be
needed once
in a decade or even once in a
century. Would you choose to
live in the
"Hundred Year Flood Plain"
without flood insurance, secure in
the
knowledge that your house will only
get washed away an average of once
per
century?

There is a
reasonable chance that you might live your entire life in
your
town and
never need any sort of communications that you don't
already have -
but
how may lives are you willing to bet on that?

Have been reading the posts and would like to know more about the Emergency side of things. Can you be part of ARES or other emergency teams if disabled. Maybe to work from your home (instead of center) or with limited traveling. I just got my General and the one meeting I heard about, they were going to walk through the woods to practice location finding. Was not happening for this girl. Just curious as I am sure I am not the only person with physical limitations that would like to help. Lori KD0QWE

Does anyone have a Baofeng UV-8 ?
Not UV-82 or BF-F8, but UV-8.

Please contact me directly at UV5R at Miklor dot Com
I'm trying to resolve a software issue and this is a bit off topic for this group.

Thanks,
John K3NXU . . . http://www.miklor.com/uv5r

Ed,

Just came back through there a few weeks ago on a trip out to Eagar and Greer. I was glad to see that most of Greer survived, but it was scary to see how close that fire came to most of the town. Worked a little 2M SSB from the top of Greens Peak near Eagar, plus a few contacts on 52 simplex with the UV-5R in both Eagar and Springerville.

Even then it was fairly cool (temp wise) on the top of the peak, but what a great view. Sad to see so many folks lose such a beautiful piece of the White Mountains in that fire (or should I say the Caucasian Mountains to be politically correct)?

Craig

Shhh. Don’t bother telling Craig he is a total idiot who cannot even read, much less understand, the different kinds of communications that are needed in an emergency and therefore thinks a 2KW HF rig is the ultimate answer to all communications requirements because it is capable of overwhelming and interfering with other EComm operators throughout the entire world.

Shh, don't tell Xuan that ham radio was the only thing that worked - he still thinks FRS bubble pack radios given out to CERT folks that can't pass a Tech license will save the day, going house to house with radios that have a range of a few hundred yards.

Actually one of the largest problems with this group is that the moderators have not banned you yet – like the moderators of all the other groups you used to belong to.

As for what either of us knows about emergency communications, I have over three decades of ham radio experience and over two decades as Communications Officer for a Red Cross service center among other qualifications – as compared to you where your major qualification is the number of groups and forums where you have been banned for life due to your constant deliberate disinformation.

If you can figure out how to spell your own name, try Googling it some time.

> I hate to tell you but it's 100% TRUTH.

Nothing you have ever posted – here or anywhere else – has ever been 100% Truth.

You were the one who told us all that your little town would NEVER need ANY emergency communications volunteers because EVERYONE who will EVER need to talk on a radio already has one.

I simply pointed out that your statement was ridiculous -- then went on to describe several common situations where the need for radio communications and especially the need for interoperability would exceed the limited capacity of your system.

You still have the mistaken idea that your County Emergency Services office can manage to handle ALL interoperability requirements (even for radio channels that they have no equipment covering) and will somehow be able to monitor a dozen or more active channels simultaneously AND inter-connect or manually relay messages among all the radio users simultaneously.

Unlike you, I have been in an Emergency Operations Center and I know that it takes more personnel than your county EMA has, just to monitor the radio traffic for even a moderate disaster.

Careful, Jardy, you are trying to explain something to Craig that he absolutely refuses to comprehend, so he is going to have to start lying about what you are saying too.

From: Jardy Dawson

The FRS radios are for close by conversations only, not over 1/2 mile. We have used them in the past with our SAR team to communicate amongst ourselves, about 300 yards or less, before we got into ham. This way, we would not interfere with any OPS freqs. FRS was NEVER designed for anything more than close by.

Craig, I must admit that I am getting tired of your deliberate lies. You have neither knowledge nor experience in emergency communications, yet you think it is appropriate to deliberately lie about my positions just to try to make some ridiculous point that you don’t even understand.

Maybe you should learn something about EComm and perhaps even participate in some training and drills (since you clearly cannot handle actual EComm operations), then you might at least have an opinion to go with your brand new Extra class ticket that you are oh so proud of. But then again, anyone who has to work as hard as you do just to remember your own callsign probably needs a lot of work to figure out how to spell EComm.

I have had better conversations talking with brick walls. Each radio service has it's own place and time, many times crossing over, like a mobile comm center listening to public safety, ham, air, and cb at the same time. Most public safety agencies have maybe 20 freqs to use, probably trunked. Ham radio operators have hundreds if not thousands of options, as they can program their radios as needed, while still following THE RULES. They can also set up cross band repeaters when and where needed, something most public safety agencies cannot do.

Just because a car can drive 120 miles an hour doesn't make it legal.

Congrats, Xuan, you have proved to me what so many previously have privately posted about you.

You either can't remember that the start of the thread mentioned both "reliable" communications and their "primary" CERT tools used or you're still fixated on trying to prove FRS UHF radios at 1/2 watt can perform as well as 4 to 5 watt radios with two bands (VHF/UHF), better antennas, far more frequencies that can be used (on UHF alone), an existing nationwide infrastructure with thousands of repeaters that can be accessed by any licensed amateur radio operator if needed, and that's not even counting the additional reach with EchoLink, IRLP, or other open linked systems like Northlink or RimLink, or private linked systems like Cactus. And yes, we also have much more powerful mobile rigs, base stations, work far more bands than just 2m and 70cm, and the ability and authorization to run more power (if we need to).

You can look this up, but I never said to "never use FRS", I simply said it isn't the best tool to use when other far better communication options are available and I hoped that any serious CERT group wouldn't consider using FRS as their "primary" communications tool, as it has many issues (IMO) that prevent it from being the best communication choice for any CERT group in a emergency or disaster situation. In the future, I'll try to articulate my opinion more succinctly so you won't misunderstand.

I also never mentioned using 2kw of power either, but you seem to suffer from a severe case of "ARE", that's amateur radio envy. I couldn't help notice in all your past diatribes (towards me and many others) that you never post a call sign, yet you always seem to feel you're the smartest person in the world on virtually every communication subject on every single occasion. I admit that a call sign alone doesn't reveal intelligence, but it does provide, if nothing else, a certain amount of credibility regarding communication matters. So what's your call again, Xuan?

Here's probably something you didn't hear much of as a youngster, Xuan. You're not always right, nor are you the smartest person on the planet, and probably not even on this forum, and before you tell me you could easily pass any communication test any government agency could administer, save your typing fingers and just post a call sign that can be verified as belonging to you, then we can have a real discussion of what amateur radio does better (or doesn't do as well as you think it should) in the world of communications. Until then, you're simply an outsider with an opinion of what you "think" hams can do (or can't do) with zero actual inside knowledge on the subject.

You do have a right to your opinion, however, but just because you feel a certain way doesn't make it the "right" way, nor does it mean that everyone else on this forum will kowtow to your opinion. Most just ignore you or delete/block your various postings.

Now before you start typing another diatribe in response, I fully admit I'd not the smartest guy on the planet either. I try to surround myself with people that I can learn more from on many diverse subjects and I know you'll think that's easier for me because I'm sure (in your opinion) that I know so little, but that's the basic difference between you and most of the rest of us, Xuan. We all want to be better, for ourselves, for our family's, and for our kids. You act as if God appeared before you right now he'd be doing so to ask you how to fix everything he created that didn't turn out the way Xuan would have done it.

So how about you try a little harder to recognize that others have the same right to an opinion as you do (even if you still think they're wrong or an idiot), and I'll try a little harder to ignore a few more of the sarcastic comments that you still slip in, and I'll even try to make a few less of them myself. It may shock you that I occasionally even agree with you on some of your points. If that works for you, great, if not, well I'm not going away.....

Craig - N7LB (what's your call, Xuan?)

A short conversation with their Motorola rep on programming "their"
frequency with a PL tone would eliminate the problem, unless the parents
have deliberately programmed the radios with the department's frequency and
PL tone. Of course then Motorola would use that as an excuse to sell them
on a new digital trunking system with all new radios .....

Rob

Help me out here...a lot of the terms you use i am not sure how they apply here..how does the pattern affect it....does it make it somewhat directional??
Also, how does the take off angle affect rx and tx?

I live in the flatlands of the Delmarva peninsula..where we are all at sea level. An antenna would be up at 25-30ft asl.

Tnx

Toshu

Any licensed ham radio operator with at least a Tech class license can sign up to belong to ARES. Whether or not your local ARES unit will accept you as an active participant depends entirely on the requirements of that local unit. Some local ARES units are very organized and very active -- others are essentially just a roster of names and callsigns kept in a file by the local Emergency Coordinator.

You can get a lot of information by starting from http://www.arrl.org/public-service and following the various links and tabs.

Also look at http://ares.ksarrl.org/ for information specifically about ARES in Kansas.

The ARES Emergency Coordinator for Shawnee County is STEVE W CARRIGER, WA0VRS, and the ARES District Emergency Coordinator for your district is KENNETH A KOPP, KK0HF, who also lives in Topeka -- you can get the full mailing address for either of them by looking up their callsign. They can tell you all you would ever need to know about ARES in your area.

That sounds like one of the training activities that some ARES units might do, but it is certainly not the only thing they do. One common job that might be suitable would be working as the radio operator at a Red Cross Shelter or at some other fixed location such as the local hospital Emergency Room.

Think of your antenna like a flashlight (although perhaps more like a lantern since it's 360 degrees).especially one that has a focus adjustment.

Whenever you see a dB rating on an antenna it's the MAXIMUM brightness spot on the beam. That dB rating does not tell you which way the beam is pointing.

Anything over 0dBd or 2.15dBi (equivalent values) can be considered directional and is just tightening and modulating the focus of your flashlight. Note that the light bulb is still putting out the same amount of light, but the beam is brighter as you've focused it.

Interactions with the ground, you, and nearby objects can actually bend and distort the beam (something you won't notice with your flashlight).

And the design of the antenna will also focus and distort the beam it's putting out and the frequency will change the pattern too.

So you can imagine that if you have an a flashlight pointing up 20 degrees above the horizon you're not going to see very far along the ground.

Imagine also your headlights on your car are misaligned and point up instead of down.you won't see the road in front of you very well at all.

In your case for flatlands you want an antenna with a low takeoff angle.

Something like the Diamond X30A (which I have) works well. I'm at a high point location so the 0 degree take off angle works well.

You'll note that the pattern is very horizontal for VHF and only slightly elevated for UHF.

http://www.diamondantenna.net/x30arad.html

Subject: Re: [baofeng_uv5r] J-Pole vs Vertical antenna

Rob

Help me out here...a lot of the terms you use i am not sure how they apply here..how does the pattern affect it....does it make it somewhat directional??
Also, how does the take off angle affect rx and tx?

I live in the flatlands of the Delmarva peninsula..where we are all at sea level. An antenna would be up at 25-30ft asl.

Tnx

Think of your antenna like a flashlight (although perhaps more like a lantern since it's 360 degrees).especially one that has a focus adjustment.

Whenever you see a dB rating on an antenna it's the MAXIMUM brightness spot on the beam. That dB rating does not tell you which way the beam is pointing.

Anything over 0dBd or 2.15dBi (equivalent values) can be considered directional and is just tightening and modulating the focus of your flashlight. Note that the light bulb is still putting out the same amount of light, but the beam is brighter as you've focused it.

Interactions with the ground, you, and nearby objects can actually bend and distort the beam (something you won't notice with your flashlight).

And the design of the antenna will also focus and distort the beam it's putting out and the frequency will change the pattern too.

So you can imagine that if you have an a flashlight pointing up 20 degrees above the horizon you're not going to see very far along the ground.

Imagine also your headlights on your car are misaligned and point up instead of down.you won't see the road in front of you very well at all.

In your case for flatlands you want an antenna with a low takeoff angle.

Something like the Diamond X30A (which I have) works well. I'm at a high point location so the 0 degree take off angle works well.

You'll note that the pattern is very horizontal for VHF and only slightly elevated for UHF.

I saw this on a bumper sticker yesterday and immediately thought of this group.

Name calling and ad hominem attacks do nothing to further the discussion of the radio, its use and application.

If you want to show intelligence, present facts, references, etc to support your position. Shouting the loudest that something is legal or not legal does not make it legal or illegal.

All you need to do is point to the law/regulation/statute itself and say "if you want to argue, argue with that".

Of course, how you choose to respond or behave knowing what is illegal is another matter.

But come on people, let's keep it civil.

>
> Congrats, Xuan, you have proved to me what so many previously have privately posted about you.
>
> You either can't remember that the start of the thread mentioned both "reliable" communications and their "primary" CERT tools used or you're still fixated on trying to prove FRS UHF radios at 1/2 watt can perform as well as 4 to 5 watt radios with two bands (VHF/UHF), better antennas, far more frequencies that can be used (on UHF alone), an existing nationwide infrastructure with thousands of repeaters that can be accessed by any licensed amateur radio operator if needed, and that's not even counting the additional reach with EchoLink, IRLP, or other open linked systems like Northlink or RimLink, or private linked systems like Cactus. And yes, we also have much more powerful mobile rigs, base stations, work far more bands than just 2m and 70cm, and the ability and authorization to run more power (if we need to).
>
> You can look this up, but I never said to "never use FRS", I simply said it isn't the best tool to use when other far better communication options are available and I hoped that any serious CERT group wouldn't consider using FRS as their "primary" communications tool, as it has many issues (IMO) that prevent it from being the best communication choice for any CERT group in a emergency or disaster situation. In the future, I'll try to articulate my opinion more succinctly so you won't misunderstand.
>
> I also never mentioned using 2kw of power either, but you seem to suffer from a severe case of "ARE", that's amateur radio envy. I couldn't help notice in all your past diatribes (towards me and many others) that you never post a call sign, yet you always seem to feel you're the smartest person in the world on virtually every communication subject on every single occasion. I admit that a call sign alone doesn't reveal intelligence, but it does provide, if nothing else, a certain amount of credibility regarding communication matters. So what's your call again, Xuan?
>
> Here's probably something you didn't hear much of as a youngster, Xuan. You're not always right, nor are you the smartest person on the planet, and probably not even on this forum, and before you tell me you could easily pass any communication test any government agency could administer, save your typing fingers and just post a call sign that can be verified as belonging to you, then we can have a real discussion of what amateur radio does better (or doesn't do as well as you think it should) in the world of communications. Until then, you're simply an outsider with an opinion of what you "think" hams can do (or can't do) with zero actual inside knowledge on the subject.

>
> You do have a right to your opinion, however, but just because you feel a certain way doesn't make it the "right" way, nor does it mean that everyone else on this forum will kowtow to your opinion. Most just ignore you or delete/block your various postings.
>
> Now before you start typing another diatribe in response, I fully admit I'd not the smartest guy on the planet either. I try to surround myself with people that I can learn more from on many diverse subjects and I know you'll think that's easier for me because I'm sure (in your opinion) that I know so little, but that's the basic difference between you and most of the rest of us, Xuan. We all want to be better, for ourselves, for our family's, and for our kids. You act as if God appeared before you right now he'd be doing so to ask you how to fix everything he created that didn't turn out the way Xuan would have done it.
>
> So how about you try a little harder to recognize that others have the same right to an opinion as you do (even if you still think they're wrong or an idiot), and I'll try a little harder to ignore a few more of the sarcastic comments that you still slip in, and I'll even try to make a few less of them myself. It may shock you that I occasionally even agree with you on some of your points. If that works for you, great, if not, well I'm not going away.....

I can't find the answer to this question on the internet.
For some reason my uv5r has entered the copying mode.
I don't know how it got there.
I would like to know how to get it out of that mode please.
I want to get back to channel mode.
Thanks for the help.
I had several friends that looked on the internet for the answer.

Hi Junior,

When the radio displays "COPING", it is trying to clone its settings to another radio. This mode is initiated by powering on the radio while any one of the following is pressed ([CALL] button, [UP] key, [DN] key or [EXIT] key). When no radio is connected to the "master" radio with a via cloning cable, the "COPING" mode usually aborts after about 2 seconds and the radio will continue to boot into Frequency Mode (VFO) or Channel Mode (MR), whichever was selected when the radio was powered off.

In your case, your radio is getting stuck in clone mode when the radio powers up. I know of at least one other person that had this issue. Their solution was to return the radio for a replacement.

The only suggestion that I can offer at this time is to check the [CALL] button, [UP] key, [DN] key and [EXIT] key to make sure none are stuck.

Well, I think the parents should get fined. They probably bought them or let the kids buy them. I think the local hams should either reach out to get some new hams or at least watch our bands. Wouldn't be surprised if they show up on 2 meters or 440 since they might hear hams talking there. Transmitter hunting anyone?

While I am a Licensed amateur radio operator, and have some decent VHF/UHF equipment. I find my set of FRS/GMRS handsets to be quite useful and fill a niche that my ham equipment can not. The thing is the rest of my family doesn't have a ham ticket.

1: My sister in law is legally blind, lives by herself about 1/4 mile away. She doesn't have proper hardwired land line, but VOIP and cell phones. Our FRS/GMRS radios are constantly set to the same tones and frequency. This has served well as an emergency pager system when needed. When the other phones weren't available.

2: They have worked well and reliably going from car to car for a distance of 2 to 3 miles. keeping a small covey together. I live in area where we have mass evacuation when hurricanes threaten. I have actually had a conversation at a 15 mile distance, over salt grass marshes with no trees or hills.
3: I regard them less of a toy than I do my amateur radio equipment which are just hobbies.

Because of some problems with a neighbor's TV years ago (and the pen pals I had at the FCC) my shack in the basement is shielded by small opening "chicken wire" well grounded, power lines to the room had ferrite cores for filtering, same with phone lines and network cables I think some of my equipment might survive :) unless the bad guys hit NYC which is only 25 miles away. BTW, the FCC boys had a good laugh when they came to look. Her twinlead was stapled to the studs in her wall and her antenna was inside the attic. We're in a fringe zone.

Hi Junior,

When the radio displays "COPING", it is trying to clone its settings to
another radio. This mode is initiated by powering on the radio while any one
of the following is pressed ([CALL] button, [UP] key, [DN] key or [EXIT]
key). When no radio is connected to the "master" radio with a via cloning
cable, the "COPING" mode usually aborts after about 2 seconds and the radio
will continue to boot into Frequency Mode (VFO) or Channel Mode (MR),
whichever was selected when the radio was powered off.

In your case, your radio is getting stuck in clone mode when the radio
powers up. I know of at least one other person that had this issue. Their

solution was to return the radio for a replacement.

The only suggestion that I can offer at this time is to check the [CALL] button, [UP] key, [DN] key and [EXIT] key to make sure none are stuck.

The use of a PL tone would not "eliminate the problem". It would only hide the problem until the frequency was being used buy authorized stations. As long as someone is transmitting the correct tone, the squelch of all receivers requiring that tone are open and any other signal on the same frequency at the same time (it doesn't matter if it is transmitting the correct tone or not) can interfere.

FRS serves a purpose for small teams working together. The nature of CERT members is that many, if not most, are not going to be licensed for amateur radio. Despite all the claims that FRS is basically useless, our CERT team trains with and uses FRS in appropriate situations. Just a couple weeks ago we successfully used FRS in a simulated disaster at a local high school. In addition to FRS for the CERT teams we had police, fire, school personnel, and amateur radio operators there a doing their respective jobs on their own radios and all communication to the team leaders at the central command post. And while the CERT team was communicating locally on FRS, the amateur radio team was trying to figure how to stop the interference from some guy transmitting with 100 watts from 40 miles away that was breaking through even though they were on separate PL tones.

I live In New London Missouri. Recently a small tornado passed right through the center of town.

All ac power in town was down. The cell tower was down.

Only people with old landline phones that were plugged in to the wall socket worked.

There were many trees down, and other important messages that were able to be passed to me, because even though the cell phones were down, our repeater was still up.

I was able to coordinate the New London and Hannibal 911 until service was restored to their communication.

Now do remember we are talking about two small towns (New London population less than one thousand and Hannibal population about 17 thousand) not New York City. And the time frame here to get corordinated was less than a half hour.

I just feel lucky that no lives were in danger during that half hour.

But once again the only thing that worked was the Ham comunity

If there is ever a large tsunami that hits the northwest (and I pray that doesn't happen), those FRS radios will be as worthless as cell phones on 9/11 in New York City.

On Tue, Oct 22, 2013 at 9:44 PM, <n7kuw@... mailto:n7kuw@...> wrote:
Very good answer by John Bee N1GNV. However, the 20 mile example should be more like 20 blocks. FRS is really intended as a VERY short range service. As soon as you enable the ability to get more range, you now have the absolute likelihood of causing harmful interference with other FRS users who are not using higher power or external antennas. You can't hear them, but they can hear you. Just like using a CB with an external amplifier. It accomplishes nothing and hurts a lot.

So the rules were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.

But, if someone in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency

communications system they designed and implemented.

Those are the reasons behind these particular rules. There are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

>>I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

I'm not an FCC lawyer, nor do I play one on TV, but…

I believe the FRS was conceived as a local, "keep in touch with friends", non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We'll never hear each other, and so we can share the frequency with no problem. As a Ham, I'm always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they're effectively limiting my range.

I think the FCC learned from the CB service. Just like Ham Radio, the available equipment lends itself easily to "enhancement", legal or otherwise. It's become virtually impossible to enforce regulations in all but the most egregious cases. It's much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

HI Bob:

I think that one of the parents (likely, the father) programmed the radio to listen in on the local EMS frequencies. He should have defeated transmit capability, and there there would not have been an issue. In any event, if the rig owner has a ham license, he should use it probably, and should have known better. If he's not licensed.... I'd say the HTs should be confiscated. I doubt the kids would be able to "tune around"... since entering frequencies is simply not a dial twist event.

If the radios were bought as toys for the boys, the parents probably new nothing about the radios other than they were reasonably priced. My guess is that they had no idea that these radios could be tuned to the public safety frequencies. They probably thought they were just FRS/GMRS radios (that's what some of the Amazon and eBay listings call them). They probably didn't purchase a computer programming cable with them (a programming cable and software is required to program memory channels are TX inhibited).

Sure it is. Look up the frequency on RadioReference.com, key it into the VFO, you're on-the-air. Or scan the VFO until you hear something, then start talking. It is way too easy to do.

Programming a PL tone would not prevent interference, only stop squelch from dropping.... the interference would still be there, and may without being heard block communications... Motorola really fubared in calling it a "Private Line" tone... *Continuous Tone-Coded Squelch System *is the proper name. The FCC should step in with a sizable fine here... ad the parents should teach their brats to keep their hands off of things that they have no clue what it is really for... 73's people

35946. Radio for use by older folks

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-26 21:16:49 UTC
From: <morris@...>
Topic: 35946 Message: 35946

This is not directly related to the Baofeng UV5R.

Looking for a two-way radio for my elderly parents to use to keep in touch with each other when they are at their vacation home. There is no cell reception there. I'm looking for two things:
1. The ability for me to set a channel and then prevent them from changing the channel.
2. A very loud alert tone that can be generated from the other handset.

Thanks in advance for any ideas!

35948. Re: [baofeng_uv5r] Understanding the FRS issue

I see no problem there. A geographic location may be a name. Just look in you own culture you will find many examples.

But it does make it hard to find any info on the guy.

Personally he or she (we don't know that either) intrigues me.
Quite intelligent but not always logical. And you find it impossible to stay out of trouble

I do hope that can be said of me as well.

Xaun Loc, I admire you

One local CERT team is sponsored by the city Fire Department.
I was told that they tried FRS radios and the overall cheapness
of them (i.e. mean time between failures) was too low, and the
usable range was abysmal.
I was also told that when the department was preparing for the
narrowbanding several years ago they bought all new radios
that they were going to license one or two additional
frequencies (public safety doesn't have to pay the commercial
coordination fees). The plan was that the radio shop was going
to take one of the retired repeaters and reprogram it and retune
it to one of the new frequencies, and give it to the CERT teams.

I have no idea if this actually happened, but that was what
was discussed. It sounds like a good idea to me - especially
since the UV5s are Part 90 legal.

Which is exactly the intent. It avoids some of the off-list harassment some
of the local trolls practice.

> Personally he or she (we don't know that either) intrigues me.
> Quite intelligent but not always logical. And you find it impossible to
> stay out of trouble

OK, I can accept that.

> I do hope that can be said of me as well.

I think you do a bit better than I do at staying out of trouble -- although
no knowledgeable and logical participant in THIS group can totally manage to
"stay out of trouble" with the assortment of lids and trolls who have staked
out this group as their home.

> Xaun Loc, I admire you

Thanks, Larry, I don't know that I deserve admiration, but I do try to help
people who honestly want help -- where I get into "trouble" is when I
respond to people posting misinformation or disinformation.

from the way the article is written, the parents bought the radios for the kids. The FCC doesn't need to fine anybody in this case.

Like we have been saying, FRS is NOT good for CERT teams nor will it ever be. The radios are in the hands of kids and kids could interfere with CERT teams using FRS BP radios. Why can't any of you see this fact?

PL tones do NOT work in FRS radios. I can plug a FRS freq into my UV5R
without a tone and can still communicate with an FRS radio that has the PL
tone in use

Why can't you see the fact that is IS useful for CERT, as they operate in close quarters only. No, it is not good for long distances. Use each radio service for what is was meant for, don't try to do something with a radio that it was not meant to do. The incident with the kids just proves that ANYBODY with one of these radios can interfere on any or all of the freqs available on the radio. There are lots of people that interfere on ham radio also.

Emmett, you say that the FCC need not fine anybody because the radios where bought for the kids.... If I buy my kid a car and he breaks the law using the car, then the cops should fine nobody at all??? the law was still broken... there is still the issues of interference and unlicensed operation.

I gotta question.

Considering how difficult it is to even program a single channel using just the paper manual.
Is it possible that the kids were just using one of the pre-programmed Baofeng test frequencies which just happened to be the frequency being interfered with?
I’ve not seen anything on this possibility.

Might it not more appropriately fall on the manufacturer to clear the memories after testing, to force the user to put in his own stuff?

The use of a PL tone would not "eliminate the problem". It would only hide the problem until the frequency was being used buy authorized stations. As long as someone is

transmitting the correct tone, the squelch of all receivers requiring that tone are open and any other signal on the same frequency at the same time (it doesn't matter if it is transmitting the correct tone or not) can interfere.

It was very unlikely they were on a test pair that matched up on a public safety freq. mine came up on the low ends of 2m and 440 ham bands. Somebody programmed it in. As was pointed out earlier, the radio was probably set up to scan ps freqs, and they went from there. Besides, I did a reset on one of mine, and the test freqs came back up.

I think what is being said is that since the FRS units are so common in stores there would more likely interference with those with other services. The interference could be actual malicious jamming to the local wannabe who wants to help but has little or no training and just gets in the way. The "fire engine chasers" might be listening there too. I think the less "popular" frequencies might be better.

> Why can't you see the fact that is IS useful for CERT, as they operate in close quarters only. No, it is not good for long distances. Use each radio service for what is was meant for, don't try to do something with a radio that it was not meant to do. The incident with the kids just proves that ANYBODY with one of these radios can interfere on any or all of the freqs available on the radio. There are lots of people that interfere on ham radio also.

Your message is lost when you say:

* CERT teams will never use FRS
* The range is so small they are useless, and
* Kids will be interfering with the CERT teams.

First of all, my CERT group DOES use FRS successfully in small group situations. Second, there are plenty of channels and privacy codes available. Regarding the range, how will kids be interfering if it is as bad as you say? The kids will have to be right next to us for us to hear them! You can't have it both ways. Either the range is good enough that kids will be all over the place interfering with every available channel, or the range will be small enough that interference won't be a big issue.

I live In New London Missouri. Recently a small tornado passed right through the center of town.

All ac power in town was down. The cell tower was down.

Only people with old landline phones that were plugged in to the wall socket worked.

There were many trees down, and other important messages that were able to be passed to me, because even though the cell phones were down, our repeater was still up.

I was able to coordinate the New London and Hannibal 911 until service was restored to their communication.

Now do remember we are talking about two small towns (New London population less than one thousand and Hannibal population about 17 thousand) not New York City. And the time frame here to get corordinated was less than a half hour.

I just feel lucky that no lives were in danger during that half hour.

But once again the only thing that worked was the Ham comunity

I also find it hard to believe that they found the frequency and started transmitting after scanning the PS bands. Most, if not all, Public Safety departments also CTCSS and/or DCS tones on both TX & RX so just having the correct frequencies would allow them to be heard without using the proper tones also.

It was very unlikely they were on a test pair that matched up on a public safety freq. mine came up on the low ends of 2m and 440 ham bands. Somebody programmed it in. As was pointed out earlier, the radio was probably set up to scan ps freqs, and they went from there. Besides, I did a reset on one of mine, and the test freqs came back up.

That erroneous argument was offered by one of the two people trying to find any reason to dismiss FRS radios without any knowledge.

> The interference could be actual malicious jamming to
> the local wannabe who wants to help but has little or
> no training and just gets in the way.

Actual experience shows that, due to the short range of these radios, that any interference at all is rare even under circumstances where it might be expected (drills conducted in a public location). Even during such drills, deliberate interference is extremely unusual and comes only from idiots illegally using higher power modified ham radios trying to prove their superiority. In an actual emergency, I have never seen a single case of deliberate interference on a simplex channel. Deliberate and unintentional interference occurs more frequently on ham repeaters -- usually because the repeater coverage area extends far beyond the area of the immediate emergency - which tends to bring out both kinds of interference that you describe.

35970. UV-3r+, UV-5R for sale

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-27 06:22:10 UTC
From: Tom Robison
Topic: 35970 Message: 35970

After having watched this site and a similar one on Facebook for several weeks, I have decided that I have neither the time, the inclination, nor the patience to program these miniscule Baofeng radios. Therefore, I offer the following for sale:

~One Baofeng UV-3R+, brand new in the box. Never used, all I did was take it out of the box and charge the battery. (this charger wall unit doesn't work, I used my cell phone charger; cable and base unit are okay). I turned it on, it comes alive, and I shut it off. It comes with the standard battery, a belt clip, an ear bud with integral PTT switch, a wrist strap, a 5" rubber duck antenna, and the charger components (base unit, cable, and wall wart).

~One Baofeng UV-5R, again, brand new in the box. I charged the battery (this charger works) and turned it on. Haven't done anything else with it. This one comes with the same accessories as above.

~One Baofeng CD5L hand-held speaker/mic, brand new in the box.

~One (unknown manufacturer) 7" rubber "whip" antenna, brand new.

~One USB programming cable for either radio above (unknown manufacturer, I ordered it as a package deal from Amazon).

~One SMA male to BNC male antenna cable adapter.

I offer the entire package above for $80.00, including shipping, to anywhere in the continental United States. The items will be sent upon receipt of a registered check or bank/postal money order. (sorry, I cannot ship outside the U.S.)

Contact me offline for further details, either by Facebook PM or at lazyace0554@.... First come, first served.

Are your elderly parents only going to stay in touch with each other over a relatively short distance (and what do you consider a short distance), and what's the area around them look like? (Dense woods, mountains, lake, etc.)

Without any type of license, they would be limited to FRS (very short distance), MURS (but additional expense), or Marine band equipment (again, at additional expense). You could also look into many of the FRS/GMRS dual-use radios that allow higher power on the GMRS side of those radios, but to be legal they would have to obtain a GMRS license (no testing, just write a check to the FCC).

Assuming they have zero intent in obtaining their ham licenses, an FRS/GMRS radio might be a good fit if their primary intent is to stay in touch with each other AND the distance between them isn't too great, otherwise they'll need to switch to the GMRS side to gain some additional range (and to stay legal purchase the GMRS license). Getting a GMRS license "could" also have some additional advantages "if" there is a GMRS repeater within range of their vacation home location and it's not a closed system.

The reality is that without some additional information, it's really difficult to suggest a radio service that will guarantee them the ability to communicate with each other without knowing their terrain, surrounding objects, etc., but as a rule of thumb (with everything else being equal), higher power radios let you talk further than less powerful radios, so radios that have 4-5 watts of power (whether they are on GMRS or Marine band), will talk further than 1-2 watt MURS radios, which will talk further than 1/2 watt FRS radios.

There are penalties involved on Marine band usage also. Usually there must be a boat involved or be talking to the Coast Guard. Land to land is prohibited in most cases. These radios are also more expensive than most GMRS/FRS. One advantage of the GMRS license is that it covers the immediate family, not necessarily one individual. I still like ham, though. Not hard to get, cheaper license, and the most versatile of ANY of the other services.

Jardy,

Yes, you are right regarding the Marine band. When I was typing earlier and mentioned lake use I should have clarified what I meant. We use them at Lake Powell so I included that example as a possibility, which I should not have without knowing where the elderly parent's vacation home was first - good catch.

The GMRS license would probably be the "easiest" for them to acquire (it's just writing a check), but I agree that the advantages of ham radio would be hard to beat for overall coverage, but elderly folks aren't always willing to try something new, plus many folks that purchase the FRS/GMRS dual use radios simply "forget" the higher wattage channels require a license to use the GMRS channels.

Craig

Speaking of Times Microwave and LMR 400 my order just came in and the cables were Times Microwave stamped here is the pictures and their contact card for those that want this cable (which is very high quality MADE in USA) mine has N connectors which I requested.

EXACTLY!

Just as you would think of Belden as a safe source of RG8 (although even they do make different quality grades of RG8), you can be confident of the quality of LMR-400 and other cable from Times Microwave. There are lots of other suppliers, some good, some bad, some so-so. If you have the opportunity, knowledge, and equipment to thoroughly test the cable, you don't need to stick with strictly name brand products -- otherwise, you usually get what you pay for.

ok, my opinion: Mr "T" Toshu Trinity, for me the choise was building my base antenna"s", where the J-Pole and commercial anetnnas tipicly have a 15 or greater degree of angle of projection at the horizon, I chose the Solid copper wire Slim-Jim. it has an angle of projection of 8 degrees, projecting or consentrating you wattage used more where you need it and not up in the flight of the birds. it is said it has upto a 8db gain over the standard J-Pole. I chose wire over 1/2" copper tubbing because of expence. I builted my @m modle for about $11 and will be adding a 70cm modle to the oppisite side of the mastfor around $6-$7.
Again, this is my opinion based on many hours compairing different designs on the internet and I am well pleased with the added signal stregnthinto the local repeators avg, about 20-30mi away and the extra power at no cost to new repeators

Excellent anology, Micheal.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Think of your antenna like a flashlight (although perhaps more like a lantern since it’s 360 degrees)…especially one that has a focus adjustment.Whenever you see a dB rating on an antenna it’s the MAXIMUM brightness spot on the beam. That dB rating does not tell you which way the beam is pointing. Anything over 0dBd or 2.15dBi (equivalent values) can be considered directional and is just tightening and modulating the focus of your flashlight. Note that the light bulb is still putting out the same amount of light, but the beam is brighter as you’ve focused it.Interactions with the ground, you, and nearby objects can actually bend and distort the beam (something you won’t notice with your flashlight).And the design of the antenna will also focus and distort the beam it’s putting out and the frequency will change the pattern too. So you can imagine that if you have an a flashlight pointing up 20 degrees above the horizon you’re not going to see very far along the ground.Imagine also your headlights on your car are misaligned and point up instead of down…you won’t see the road in front of you very well at all. In your case for flatlands you want an antenna with a low takeoff angle.Something like the Diamond X30A (which I have) works well. I’m at a high point location so the 0 degree take off angle works well.You’ll note that the pattern is very horizontal for VHF and only slightly elevated for UHF.http://www.diamondantenna.net/x30arad.html Mike W9MDB From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com] On Behalf Of Toshu Trinity

Rob

Help me out here...a lot of the terms you use i am not sure how they apply here..how does the pattern affect it....does it make it somewhat directional??
Also, how does the take off angle affect rx and tx?

I live in the flatlands of the Delmarva peninsula..where we are all at sea level. An antenna would be up at 25-30ft asl.

Tnx

Toshu

I never said that WAS what happened but that was the thinking. Of what you said is correct if you look at it from the point of, lets say, 10 idiots per square mile, the greater the range, the more likely you'll get idiots on there. :)
I used to be involved with the old Civil Defense but quit because the hams that were involved with that in my county either wanted a free piece of equipment or on a power trip themselves. I guess it depends on the area.

That's true: A GMRS license covers a very extended family: spouses, parents, grandparents, children grandchildren, step-children, step-parents, brothers, sisters, aunts, uncles, nieces, nephews, and in-laws. Oh, and the licensee, too. :)

The licensee must be at least 18 years old, and pay the license fee.

Marine band does not require an individual license (on small non-commercial boats) BUT it is only legal while afloat -- which would mean that both "elderly parents" would have to be afloat to legally use marine band radios to talk to each other -- I suppose it is possible that they might both be out boating in separate boats at the same time, but unless they are kayakers that sounds rather unlikely. Even if one of them were in a boat, it would be illegal for the one who was ashore to use an unlicensed marine band radio to talk to the one in the boat. Marine band shore stations ALL require licensing.

> You could also look into many of the FRS/GMRS

The GMRS license is a little expensive ($85 last time I looked), but it does cover the entire family (not just those living in one household). By carefully choosing whose name was on the license, they could cover a lot of people with one license -- FIVE GENERATIONS plus in-laws:
(1) Licensee;
(2) Licensee's spouse;
(3) Licensee's children, grandchildren, stepchildren;
(4) Licensee's parents, grandparents, stepparents;
(5) Licensee's brothers, sisters;
(6) Licensee's aunts, uncles, nieces, nephews; and
(7) Licensee's in-laws.

Another possibility with GMRS is the use of a decent rooftop antenna at the vacation home, perhaps connected to a real GMRS mobile radio. This would offer several times the range that could be expected using HTs at both ends.

I hope you are using marine band from one boat to another -- not between a boat and the shore. Marine band shore stations do still require licensing. It seems that your use would qualify for a license as a “Public Coast Station under Part 80, Subpart J (Sections 80.451-80.481)

47 CFR Section 80.13
Station license required.
(a) Except as noted in paragraph (c) of this section, stations in the maritime service must be licensed by the FCC either individually or by fleet.
(b) One ship station license will be granted for operation of all maritime services transmitting equipment on board a vessel. Radiotelegraph and narrow-band directing-printing equipment will not be authorized, however, unless specifically requested by the applicant.
(c) A ship station is licensed by rule and does not need an individual license issued by the FCC if the ship station is not subject to the radio equipment carriage requirements of any statute, treaty or agreement to which the United States is signatory, the ship station does not travel to foreign ports, and the ship station does not make international communications. A ship station licensed by rule is authorized to transmit radio signals using a marine radio operating in the 156-162 MHz band, any type of AIS, any type of EPIRB, and any type of radar installation. All other transmissions must be authorized under a ship station license. Even though an individual license is not required, a ship station licensed by rule must be operated in accordance with all applicable operating requirements, procedures, and technical specifications found in this part.

Section 80.15
Eligibility for station license.
(a) General. A station license cannot be granted to or held by a foreign government or its representative.
(b) Public coast stations and Alaska-public fixed stations. A station license for a public coast station or an Alaska-public fixed station cannot be granted to or held by:
(1) Any alien or the representative of any alien;
(2) Any foreign government or its representative;
(3) Any corporation organized under the laws of any foreign government;
(4) Any corporation of which more than one-fifth of the capital stock is owned of record or voted by aliens or their representatives or by a foreign government or its representative, or by a corporation organized under the laws of a foreign country; or
(5) Any corporation directly or indirectly controlled by any other corporation of which more than one-fourth of the capital stock is owned of record or voted by aliens, their representatives, or by a foreign government or its representatives, or by any corporation

organized under the laws of a foreign country, if the Commission finds that the public interest will be served by the refusal or revocation of such license.
(c) Private coast and marine utility stations. The supplemental eligibility requirements for private coast and marine utility stations are contained in § 80.501(a).
(d) Ship stations. A ship station license may only be granted to:
(1) The owner or operator of the vessel;
(2) A subsidiary communications corporation of the owner or operator of the vessel;
(3) A State or local government subdivision; or
(e) EPIRB stations. (1) Class A or Class B EPIRB stations will be authorized for use on board the following types of vessels until December 31, 2006:
(i) Vessels authorized to carry survival craft; or
(ii) Vessels expected to travel in waters beyond the range of marine VHF distress coverage which is generally considered to be more than 32 kilometers (approximately 20 miles) offshore; or
(iii) Vessels required to be fitted with EPIRB's to comply with U.S. Coast Guard regulations.
(2) A 406.0-406.1 MHz EPIRB may be used by any ship required to carry an EPIRB pursuant to 46 CFR subpart 25.26 or CFR 28.150, 117.64, 117.200, 133.60, 180.64, 180.200, 180.204, 180.205, or 199.510, or by any ship that is equipped with a VHF ship radio station. An INMARSAT-E EPIRB may be used by any ship required by these U.S. Coast Guard regulations to carry an EPIRB or by any ship that is equipped with a VHF radio station, provided that the ship is not operating in sea area A4 as defined in § 80.1069(a)(4).

Note to paragraph (e)(2): Service to INMARSAT-E EPIRB stations terminated on December 1, 2006, so distress signals from INMARSAT-E EPIRB stations will not be received by any Rescue Coordination Center.

Section 80.17
Administrative classes of stations.
(a) Stations in the Maritime Mobile Service are licensed according to class of station as follows:
(1) Public coast stations.
(2) Private coast stations.
(3) Maritime support stations.
(4) Ship stations. The ship station license may include authority to operate other radio station classes aboard ship such as; radionavigation, on-board, satellite, EPIRB, radiotelephone, radiotelegraph and survival craft.
(5) Marine utility stations.
(b) Stations on land in the Maritime Radiodetermination Service are licensed according to class of station as follows:
(1) Shore radiolocation stations.
(2) Shore radionavigation stations.
(c) Fixed stations in the Fixed Service associated with the maritime services are licensed as follows:
(1) Operational fixed stations.
(2) Alaska-public fixed stations.
(3) Alaska-private fixed stations.

Barry, you know very little about amateur radio operators, and it is quite
obvious that you are not at all interested in learning.

Amateur radio operators are not mature enough to do any serious work.

Seriously? That is why most Red Cross offices have a spot setup for a HAM operator when a disaster strikes. Because we can't handle it? Not mature enough? Wow....

Prolly need to set a PL tone - are you trying to hit a repeater, or
operate simplex?

When using repeaters, you'll need to set an offset, and often a
specific PL tone.

Did you get a programming cable with your Baofeng?

Who is "on the other end"? What frequency are they listening on? What frequency are you transmitting on? Does "the other end" require a CTCSS tone or DCS code to open their squelch? If they do, are you transmitting the required tone or code?

Xuan, I have made some rather unique posts but you sir, ARE JUST
PLAIN OUT OF LINE HERE!

This is why this baofeng group sucks, people like you who DON'T KNOW
Jack crap about emergency comms at all.

I hate to tell you but it's 100% TRUTH. ALL agencies WILL call upon
Hams to help when all other means fail.

This USE a cell phone mentailty that most of you have will probably
KILL somebody in an emergency situation.

Your post is exactly why encryption IS needed on the ham bands. I
know for fact that when main radio systems and their backups are
down and cell towers are down that amateurs will be called upon as a
SHTF force.

Most of you don't even know the real meaning of the hipaa act.

I suggest that you take another CERT course or just give up your
amateur license.

No wonder Radio reference and this group went to shit, it's because
of wanna be know it alls like your sorry ass.

Hams can't be trusted when lives are at stake.
Hams are children playing two way radios. They are not mature enough
to do anything properly.

Many hams are fully capable of handling emergency communications tasks -- and, unfortunately, many are not.

Red Cross (and many other served organizations) resolve this potential problem by maintaining a cadre of known ham radio operators, who have completed training provided by the served organization.

Perhaps you remember all the furor among the ham community when the Red Cross announced that ham radio operator volunteers would be required exactly the same background checks as all other Red Cross volunteers. Hams were so opposed to meeting the same minimal standard as other volunteers that the ARRL had to extort the Red Cross into exempting hams.

OK, that answers most of the questions we really needed to know.

The basic answer is that the radio won't talk to the other people because these radios are all equipped with a psychic ability that lets the radio know that you are not licensed or authorized to transmit – therefore the radio won't let you break the law by transmitting illegally.

And, of course, the fact that you have no clue what frequency you need to be transmitting on or whether you need a CTCSS tone or DCS code, so even if the radio believed you were legal you still wouldn't be able to make it work.

So you would start by getting authorization from the actual license holder, then you would talk with whoever programs the radios for your employer to find out what frequencies are used and what tones or codes are needed.

We need a LOT more information before anyone can offer more than random guesses.

How did you program the radio?

Are you trying to transmit on a simplex frequency or through a repeater?

How do you know you are not transmitting?

What frequency are you using?

Hi to all.

I have been a ham for the last 25 years and been involved for few years as a volunteer in a civil protection group in Spain. Now living in sunny Miami where a hurricane can hit anytime. But all this communications issues comes to basically one common thing: National Weather Service use "spotters" mostly hams, when SHTF during hurricanes there is WX4HNC getting reports from nice radios own by upps, hams. and if we look closer we can see that during a lot of public events there are a lot of volunteers (HAMS again) providing communications. Now the Boston marathon was one of this events where hams where providing this comms and immediately after the bombings this event communications where Emergency Communications providing essential info on what was going on (all this well documented even on a ARRL magazine). Now, the main difference here is one: we don't have a clear idea or info on what is what.

CERT or Community Emergency Response Team are a group of people TRAIN BY THE LOCAL OR STATE emergency entities to provided first response and assessment after a disaster in a reduce area where FRS/GMRS are suitable due to the small area that they take care of. This CERT where create based on the fact that emergency services after a disaster WILL NOT be able to attend to everybody and based on the info relayed by this groups can channel the help to the areas with more casualties. This groups are form by religious, or other type of groups.

HAM on the other hand provided a wider area communications and have the ability to set up emergency communications in a matter on hours to link shelters,food centers, hospitals,etc. to OEM and FEMA centers to provided info relay stations.

Now been there did that I can assure any professional there that their system is 95% fantastic until SHTF. that's when you will learn one important thing trunked systems are good until couple of towers fails. and regular radio systems when those tower fails the entities depend on a company to repair those towers. an meanwhile back in the ranch people is complaining that you don't do S. Of course you cant talk to each other.

Now the bottom line is: THAT WHY HAM IS CONSIDER A PUBLIC SERVICE BY FEMA AND IS AN INTRINSIC SERVICE IN ALL THEIR EMERGENCY PLANS. But not only here in Spain part of the regulations for hams is that in case of a major disaster hams are to provided communications thru the Civil Protection Directorate first the members of REMER and in case more are needed the rest of hams.

So lets not discriminate anybody and if you are a pro think that your millionaire radio system can fail and your life can depend on one of us "un"-trained radio operator.

Alex/KG4TRV

So Dale, what your saying is? That we Amateur Radio Operators that have provided many countless hours, training and community service to our communities with their radios have nothing to do for the communities, we live and provide a public service to when we are called upon?

Do yourself a favor try asking that same question to more than a 100,000+ Amateur Radio Operators in the United States, that very same question - I will bet you, that karma will bite you hard in the rear as a hungry K9 starts barking up your tree and alley cat - you will be amazed at how much Amatuer radio does in service to our communities and worldwide.

Did you know that ONLY ONE HAM during the HATI Earthquake was able to get amateur radio traffic out of the country to the world, while it was in despair from a massive earthquake and there were no other hams available immediately after the first quake shook the region.

Did you know that during Hurricane Katrina and Hurricane Sandy - Amateur Radio also played critical and key roles after the storms passed through the area. Did you know that the entire New York Metro and New Jersey Area lost several key repeater sites, along with tons of police, fire, ems and other public safety repeater after the Twin towers feel during 9/11? - again, Amateur radio played a key role in providing emergency communications and more during these disasters I've mentioned and countless disasters before them.

Now, don't sit there and tell me the Amateur Radio communications is a skunk and doesn't work - it does work well and is more structured and reliable reliable radio system around than those in the public safety and other radio systems because of red tape and more.

I'd have to agree with folks on this list - Amateur Radio does work when all else fails, the same thing for those who Volunteer in their Fire Department, Emergency Medical Services, Search and Rescue and other private or government agencies that provide public services to our communities.

Did you know that more people are volunteering their time to the communities they live in and are getting license with Amateur Radio these days? Remember a lot of us on this list provide communications to our communities when called upon in an emergency and you can bet some of us might even be CERT's as well to our community.

Be wise, smart, look around you, open your eyes to the opportunity to learn more in your community about sharing your radios, get involved with a public service agency that provides and uses amateur radio for their public service needs, you'll be surprised in what can be done and transpire, where

the John and Jane Doe didn't even know that existed in the first place.

Got to like the veracity and enthusiasm contained in these emails.
At the same time, opinion and viewpoint serve best when there is dissimilar thought.
Please don't allow that wonderful gift to descend into personal animosity.

Just say what you believe, as both of you did. I enjoyed the exchange.
Donn, KA0SOH

Hams can't be trusted when lives are at stake.
Hams are children playing two way radios. They are not mature enough to do anything properly.

I would watch what you say OM.

FYI, the ONLY radio systems that survived Katrina
were the ones that were built and maintained by
volunteers - Amateur Radio and the Civil Air
Patrol (the volunteer side of the Air Force).

NY / NJ areas used trunked systems for Police & Fire. The
trunking controller system was located in a room on one of
the top levels of the first tower to fall.

No wasn't saying that at all...I was referring to the poster that was
saying US Hams can't be trusted, we are children and immature.
I think Jeff you need to read the thread properly and notice who I was
responding to.
As you can see I have put my response in the proper order just like we
talk to each other from bottom to top.
Do you reply to a PSK31 comm. at the top?

Jeff,

The total number licensed is actually well over 700,000. See this graphic from http://frrl.wordpress.com/2012/01/21/700000-amateur-radio-operators-in-the-us-perhaps-the-real-number-is-157000/

More statistics at http://ah0a.org/FCC/index.html

Unfortunately I could not find any statistics on how untrustworthy and immature hams are. ;-)
I think most of us will stand up and be counted in that group of children who like to play with two-way radios. :-D

Dale,

I misread your comment, also.

If we had been sitting and chatting in person, this miscommunication would probably never have happened since it would have been realized immediately.

HOWEVER, when these threads become embedded inside embeds inside other embeds, not every email system shows them the same way...I use Thunderbird email and depending on MY settings as well as the each SENDER'S settings, it can show the sequence up or down, as well as up AND down, and as well as indented to the right with colored lines and symbols such as ">".

As I am typing this email, I can see 6 levels already, counting my response. To read the sequence in order, I have to start actually in the middle (greatest indent to the right) then go up, then down, down, down, up, then down, then finally, up where I am typing my comment.

If we add a comment directly to someone's comment who has not signed his message, it can look like it is all one comment.

This can make it very difficult to follow the sequence accurately.

I don't have solution for this...except we need to be very clear and careful.

I assume that the radio and plugs do NOT need to be disassembled when using the Qtip cleaning method you mention???

Tnx

On Monday, October 28, 2013 3:29 AM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

As
we know our toy wonder has a major problem in one area that seems to show up every so often. Those that are dealers (Kurt) will know that this issue is a hassle with bad internal inop mics as returns.

The
mic circuit requires a closed contact to provide the circuit the proper pwr and ground lines. A stuck open contact removes one of the legs of the circuit- thus an inop internal mic while and external mic will work.

A
few months back I found the probable cause of this issue, which is connected to the epoxy seals on the top portion of the jack. The seal lays on top of the contact pins and the sticky glue backing causes the pins to stick open or have residue on the contact surface which will not allow the contact to close.   Replacements from 409 shop do not have that seal (picture 2)

Some
suggested air into the socket or plugging in the cable a few times, none of these worked for me requiring me to replace the jack in one radio which fixed the problem.

I
recently had time to fool with this again, with 7 radios all bad with int mic probs all I did is put a custom trimmed down Q-tip in the hole saturated with Denatured Alcohol. I did this a few times as this was a good enough solvent to remove the sticky residue on the main board. Out of the 7 radios 5 are now working,

A
simple fix might help those that had to disassemble their radios in the past to fix. Sorry for the crappy Iphone pictures

below
no seal on the left (removed) , epoxy sealed factory veneer on the right (yellowish film epoxy veneer)

409 replacement jack no seal contacts properly closed

Cable in a jack with open contacts- glue on veneer caused these to stick open or close with the veneer bonding glue on the contact heads

Simple mic circuit diagram

Can I add my 2 cents in? In my County of Bergen, I was called in to do CERT and staff shelters. My ambulance corp called an all hands prior. Our building had no power. The PD and FD did. Working off a generator, we had little power. When I finally made it to the college, I had to tell my Det that a tree was down on a ramp getting there and that I had to take a different route. My portable would not reach Mahwah, from Paramus. When I arrived, I saw the setup of the shelter, and a small hallway with radios, equipment and generators. The generator for the college failed. RACES and HAM Operators were able to talk as if it was a phone all over the area. They were able to get much needed info and even setup a small TV. From what I learn and things I was clueless about, stuck with me and I am now a HAM Operator. My town does not have CERT or RACES. I'm working to change that. So, HAM/RACES/ARES/CERT is needed more than before. In fact, we had a drill and I asked if we had RACES. The patient actor did not want to hear anything but her children. I know as an EMT, her health won't get better until she was able to see them. I called for RACES. It ended that scenario just by using RACES. It works IF we do our part. For the individual that believes it doesn't, wait until you are needed. Then you will change thoughts!

Mike,

wow, even I could understand that explanation...almost!! ;-)

So in the case of the Diamond X 30 plots, most of the signal is directed in a horizontal plane (90*), where as little or no radio waves are going straight up or down. If I am trying to hit repeaters 30 miles away that are up at 300-800 ft, directing most of the energy in a near horizontal manner should reach further out.

I did find a radiation pattern for the Arrow OJP antenna>
http://arrowantennas.com/inst/igif/2mrad.gif

It appears the with it, nothing is transmitted Down, below the horizontal plane(base of the antenna?), but a lot is sent up, similar to a donut, but with nothing going straight up, at 0*.???

On Saturday, October 26, 2013 9:08 AM, Michael Black <mdblack98@...> wrote:

Think of your antenna like a flashlight (although perhaps more like a lantern since it's 360 degrees)…especially one that has a focus adjustment.
Whenever you see a dB rating on an antenna it's the MAXIMUM brightness spot on the beam. That dB rating does not tell you which way the beam is pointing.

Anything over 0dBd or 2.15dBi (equivalent values) can be considered directional and is just tightening and modulating the focus of your flashlight. Note that the light bulb is still putting out the same amount of light, but the beam is brighter as you've focused it.
Interactions with the ground, you, and nearby objects can actually bend and distort the beam (something you won't notice with your flashlight).
And the design of the antenna will also focus and distort the beam it's putting out and the frequency will change the pattern too.

So you can imagine that if you have an a flashlight pointing up 20 degrees above the horizon you're not going to see very far along the ground.
Imagine also your headlights on your car are misaligned and point up instead of down…you won't see the road in front of you very well at all.

In your case for flatlands you want an antenna with a low takeoff angle.
Something like the Diamond X30A (which I have) works well. I'm at a high point location so the 0 degree take off angle works well.
You'll note that the pattern is very horizontal for VHF and only slightly elevated for UHF.

EXACTLY!

Just as you would
think of Belden as a safe source of RG8 (although even
they do make
different quality grades of RG8), you can be confident of the
quality of
LMR-400 and other cable from Times Microwave. There are lots of
other
suppliers, some good, some bad, some so-so. If you have the
opportunity,
knowledge, and equipment to thoroughly test the cable, you
don't need to
stick with strictly name brand products -- otherwise, you

usually get what
you pay for.

A vertical antenna will have deep nulls above and below.

That’s how you can get away with a transmitting and receiving antenna that are stacked one on top of each other.

A horizontal antenna like a diploe will have the nulls off the ends.

Should you try using a vertical antenna on a horizontal signal you will experience a 3dB loss in signal and visa-versa.

During long range communication it is possible for the polarization of the signal to skew.

This depends on many factors.

36024. RE: [baofeng_uv5r] J-Pole vs Vertical antenna

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-28 14:21:07 UTC
From: Michael Black
Topic: 35728 Message: 36024

You are interpreting that radiation pattern correctly. And 300-800 feet up at 30 miles is just 0.1 to 0.3 degrees to a 0.0 degree pattern is desirable making the X30A a better choice me thinkst.

Remember the flashlight analogy. According to the arrow pattern plot it is defocused (looks pretty omni-vertical to me except for almost straight overhead which makes sense for a dipole without any radials).

I note they don't show any gain numbers at all and I'm imagining it isn't 3dB like the X30A.

So to me this pattern would be most useful in a valley with receivers on high points but it would also beat a standard dipole and a standard J-Pole (which this antenna isn't) since it both folds the pattern in half and has what looks like good horizontal propagation.

A standard J-Pole has a slightly elevated pattern with the main lobe at 13 degrees which is a tad undesirable for a lot of users unless you're in that valley again. I've heard of some hanging theirs upside down when on high points.

http://home.telkomsa.net/jeanward/j-pole.html

The Diamond X30A focuses the energy along the horizontal plane and is down notably at 10 degrees for VHF and 20 degrees for UHF.

36025. Re: [baofeng_uv5r] Understanding Emergency Communications Volunteers

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-28 09:08:59 UTC
From: Craig Carnahan
Topic: 35842 Message: 36025

According to the FCC and ARRL, there are currently more than 700,000 licensed amateur radio operators within the U.S., and like any group of that size, some folks like to just rag-chew on any band available to their license, some prefer low band operation, some live for contesting and DX, and some wrap their love of the hobby in with various EMCOMM operations.

Problems arise occasionally when some that "live for" one part of the hobby clash with folks from another sector of the hobby, but those problems are normally quickly resolved in order for the overall hobby to prosper and grow. Most hams are known for their ability to get along with just about anybody.

One issue that hasn't been resolved (yet) is when folks at a national level fly into an area and "take over" an operation with little to no actual knowledge of what it takes to respond to their demands of what they want done and when they want it completed. (I'll use the Red Cross as an example, but it could just as easily be any national organization or government agency that supplies some sort of EMCOMM activity).

Just so we're clear, I'm not knocking the thousands of volunteers any group has, or the work they perform, just the faceless bureaucrats within those organizations or gov't agencies who sole job in life seems to be designing new certifications their unpaid volunteers have to now get (in addition to all the previous certifications) to be "certified" to work the same volunteer work they have already done for years, plus many of those same bureaucrats have next to zero knowledge of the actual work needed to make their new "solutions" work.

For example, when many of the amateur radio operators were "told" that the Red Cross bureaucrats had already decided to scrap the donated ECRV vehicles located all over the country (jammed with various radio gear, generators, lights, rugged laptops, a satellite uplink, and a hydraulic tower system) and instead replace it with a single satellite uplink system that would be flown into a disaster site when needed. Most hams immediately saw the problem with this one-vendor, one-technology "solution", but the Red Cross bureaucrats basically told them to pound sand, the decision had already been made (with no input from the folks that actually have to make this comm gear actually work), and make the best of it.

Worse, most of this new gear would arrive just hours before being needed, and the volunteer hams (deemed with the task of making it work) had been given zero time to work with the gear prior to it being shipped, as the new "toys" were to be stored at a central facility and only sent out when needed. The new sat vendor had assured the RC bureaucrats their system was

a "breeze" to install and communications could be established anywhere in the world within minutes of deployment, and with no one in charge at the RC that actually understood what was needed, no hard questions were asked, no real world tests conducted, no guarantees of deployment time written into the contracts, etc., etc.

So of course you end up with folks that are already steaming that their expertise wasn't even asked for during the planning stages, the equipment that they know and are extremely familiar with has been pulled from them, plus they get zero time with the new equipment to learn that vendor's "little" issues with setup and deployment, but they're expected to make it all work within tight deadlines - regardless of the bureaucrat's decision or their lack of expertise with the technology in the first place. (Several of the paid bureaucrats within the RC have admitted that they don't understand any of the communication technology they are in charge of, their backgrounds are in computers and networking).

Not directly related to the RC bureaucrats, but related to what can happen when folks are in charge of communication technology that shouldn't be, most of you are familiar with the national story of the 19 men that lost their lives fighting a wildfire near Prescott, AZ several months ago. A few of you might have read (or heard) of the first report issued regarding the tragedy. It was revealed in the report that the radios carried by the firefighters weren't even programmed correctly. We still haven't been told which government employee was in charge of making sure the equipment was properly programmed before the deployment to fight that fire (we were told it was NOT the job of the firefighters). This is the type of "mistake" that's made when individuals don't know what they are really doing are in charge of technical equipment, or they are simply rushed and miss obvious issues (like multiple radios not being properly programmed with the correct frequency and tones).

The Prescott, AZ fire just happened to be one of the first deployments for the new RC sat system as well. What a disaster. What the vendor had assured the RC bureaucrats would take "only minutes to deploy" dragged on for a full 36 hours, while countless RC volunteers had no way of "officially" performing their assigned tasks. Naturally, the hams there rigged a "unofficial" system to be used during the day and a half the vendor's tech support folks kept trying different steps to try to resolve why their "easy" system wasn't working.

I'm not knocking any normal common sense stuff the bureaucrats come up with like background checks, although I know a great many folks within various EMCOMM groups that do take a certain amount of affront to it - primarily because of how poorly some of the bureaucrats role out the "and now here's another thing you need to do" and "no, we can't give you any guarantee that the personal information we're asking you to provide us on another form (for your volunteer work at no pay) might not be compromised someday, in fact, we can't even tell you what steps, if any, will be done to protect your personal information or even which folks will have access to it once we have it".

Many of the hams I know that have been heavily involved with the ECRV Red Cross efforts for many years are dropping out. Some because of the attitude they get from the bureaucrats, some because of the total lack of appreciation of the free work provided (many times being away from their families for weeks at a time), but many also due to the fact that the paid RC bureaucrats look at them as common day sharecroppers, willing to put up with almost anything for the thrill of telling folks that they do EMCOMM work for the Red Cross.

It's gotten to the point now that on many RC call outs they have to fly in 2 man teams from across the country to man the communication equipment, so many of the "local" teams are suddenly unavailable at much higher rates than in previous years. No problem, through, these sat systems are so simple to set up virtually anyone can do EMCOMM nowadays, just ask the sat vendor's sales department.

I'm afraid that by the time many of these national organizations (and government agencies) find out what they have lost (in both manpower and communication expertise), all they will have left are the faceless EMCOMM bureaucrats telling each other that their systems "should" have worked, just like they did during Katrina and Sandy. I guess we'll just have to count on ham radio operators again and again - when all else fails.

36026. Antenna for marine VHF use

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-28 15:00:37 UTC
From: <keith_rhodes@...>
Topic: 36026 Message: 36026

I wonder, could anybody here recommend an antenna suitable for marine VHF frequencies, 156.0 to 162.025 MHz?

I've used CHIRP to program one of my UV-5R units, and done a quick test using my iCOM dedicated marine VHF transceiver, and everything looks OK.

But before using the Baofeng, I want to make both ensure that the stock antenna is not going to cause problems on marine VHF, and find out if there's a better antenna for these frequencies.

Hay guys - when taking close-up photos, use the macro function on your camera - it's the icon of the flower. This will adjust the focus so that very close-up objects are nice and sharp and clear. Give it a second to focus.

For best results, sit both the camera and the object to be photographed down on something, and use the timer - the image will be clear and razor sharp!

One suggestion, Ray, it is rarely a good idea to publicly document committing a felony, especially if you provide a link to your full name & address, as well as pointing out that you are associated with the auxiliary to a federal government law enforcement agency that might otherwise ignore your violation of both federal law and their own regulations, but who would have a hard time ignoring it if the complaint were sent to the district commanding officer, Commander Paul Arnett, or the district legal officer, Martin C. Mooney Sr.

As we know our toy wonder has a major problem in one area that seems to show up every so often. Those that are dealers (Kurt) will know that this issue is a hassle with bad internal inop mics as returns.

The mic circuit requires a closed contact to provide the circuit the proper pwr and ground lines. A stuck open contact removes one of the legs of the circuit- thus an inop internal mic while and external mic will work.

A few months back I found the probable cause of this issue, which is connected to the epoxy seals on the top portion of the jack. The seal lays on top of the contact pins and the sticky glue backing causes the pins to stick open or have residue on the contact surface which will not allow the contact to close. Replacements from 409 shop do not have that seal (picture 2)

Some suggested air into the socket or plugging in the cable a few times, none of these worked for me requiring me to replace the jack in one radio which fixed the problem.

I recently had time to fool with this again, with 7 radios all bad with int mic probs all I did is put a custom trimmed down Q-tip in the hole saturated with Denatured Alcohol. I did this a few times as this was a good enough solvent to remove the sticky residue on the main board. Out of the 7 radios 5 are now working,

A simple fix might help those that had to disassemble their radios in the past to fix. Sorry for the crappy Iphone pictures

below no seal on the left (removed) , epoxy sealed factory veneer on the right (yellowish film epoxy veneer)

409 replacement jack no seal contacts properly closed

Cable in a jack with open contacts- glue on veneer caused these to stick open or close with the veneer bonding glue on the contact heads

Simple mic circuit diagram

Xuan, what is the felony do you think that Ray might have comitted? Is it something about using a Baofeng UV-5R on marine VHF channels on a lake, rather than ocoastal waters, or is there something about FCC regulations that mean that the UV-5R should not be used like that?

I'm not in the US, so the FCC regulations don't affect me, and looking at the info I can find it seems that marine VHF transceivers are regulary in the 1W to 25W range, so a little 5W handheld shouldn't be a problem because of power… Maybe frequency accuracy? Or just is this unit not certified by the FCC for use on those frequencies?

From: Karl Schwab
Topic: 35946 Message: 36039

Somewhere in the Baofeng on-line documentation, it is recommended that a thread locker, such as Loctite not be used on screws going into the radios plastic; it may damage the plastic, i.e. , melt it! If a thread locker was still to be used, use the "blue" instead of the "red". When red is used, one would never ever be able to remove the screw; with blue, you might have a chance! For what it is worth, Karl

On Monday, October 28, 2013 8:13 AM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

Here
is another easy fix for the record, some of the radios (especially the camo
ones) have stuck batteries that are hard to pull out if changing them or going
to the 3800 ext battery.

To
fix this one, first loosen the belt clip screws and try to remove. If that
doesn’t work try the 2 top screws.

Once
the battery is removed tighten the screws slightly until they are tight enough
but loose enough to easily remove the battery.

If
the screws seem too loose use a small dab of red loctite as a seal to hold the
screw in place so they will not work out.

The
case lip sometimes is slightly warped and with too tight screws the battery
latch will not fully open as it pivots against the warped case which causes the
battery to stick. After use the case loosens a little bit making battery
removal easier but right out of the box some are very tight and hard to
remove.

Antenna
coupler screw

Same
thing these come loose if you use a tight fitting antenna or a heavy one that is
removed often. This happens especially if you use an O ring spacer to fill
in a gap area. What happens is the base or the O-ring sits on the antenna
coupler screw nut, as you turn it for on and off use the nut works loose- then
the whole jack becomes wobbly.

Tightened
the screw you can make a small tool with notches on it from small Hobby tubes
sold at Lowes or Home depot. Just dremel the bottom so the tube will have
notches in it to act as a wrench to tighten the nut. Use the nut as a

guide to make your tool notches.

Once
tightened you can use Loctite red on the screw threads at the base were the nut sits. Remove any excess as it should only be around the nut to shaft area. Let dry and it will lock the antenna coupler nut to the screw.

I'm well aware of how tones work. You have to remember that most public service users don't. They simply want to hear what is related to their job. So radios are almost always programmed with tones enabled on the received as well as for transmitting. Thus most likely they would not have known what the interference was if the children's radios weren't also transmitting using the proper tone.

Spin it any way you want but I'd be willing to wager the radios had the proper transmit tones programmed in along with the correct transmit frequency.

  Gary, all the tones do is drop squelch... You can still hear if you drop the squelch by hand or set to no tone, so there is how to find the freq, and also you can be blocked by a signal that your radio is not dropping squelch for, therefore setting the tone may keep any random junk on freq from bothering you needlessly, but will also stop you from hearing that guy who is blocking legit traffic.... for these purposes PL and CTCSS are little more then a good joke... matter of fact, right now, I have a scanner I borrowed from a friend listening to the inputs of my area's repeaters... and do from time to time hear something that fails to key the repeater, as though someone not from around here forgot to set the tone, or set it wrong.

Chad

36044. Re: [baofeng_uv5r] Antenna for marine VHF use

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

As everyone who has been here for more than a few days knows quite well, the UV-5R is only authorized for use under Part 90 and Part 97 in the United States. In the US, it is ILLEGAL to use this radio on frequencies regulated under Part 95 (FRS, MURS, GMRS) or Part 80 (Marine band).

Since you are in France, your use of the radio is not subject to FCC regulations, but Ray is in the US and his use of the radio is regulated by the FCC.

Your use of the radio in France is regulated by French government authorities. My French is a bit too rusty for me to get very far following the websites of the Agence Nationale des Frequences and the Association Française des Opérateurs Mobiles, so I’m not even going to try to guess what the rules are in your country.

This is an example of why it is important for people to know what country someone is operating in while trying to help them. Advice that is correct in one country can often lead to criminal misconduct in other countries. Many countries have rules that are somewhat less technical than those of the US, but at the same time, most of those countries have far stricter penalties for violating their rules. The $10,000 fines common in the US may seem serious to most people, but they are not as bad as jail time which are possible in many countries simply for possession of an unlicensed or unauthorized radio (especially one CAPABLE of operating on a government frequency)

From: keith_rhodes@...
Xuan, what is the felony do you think that Ray might have comitted? Is it something about using a Baofeng UV-5R on marine VHF channels on a lake, rather than ocoastal waters, or is there something about FCC regulations that mean that the UV-5R should not be used like that?

I'm not in the US, so the FCC regulations don't affect me, and looking at the info I can find it seems that marine VHF transceivers are regulary in the 1W to 25W range, so a little 5W handheld shouldn't be a problem because of power… Maybe frequency accuracy? Or just is this unit not certified by the FCC for use on those frequencies?

And, considering the ages of the kids involved, I would bet that the frequencies and tones were programmed by one of the parents. I would guess that the parent programmed the radio intending "just to listen" -- or perhaps one of the parents is a ham who programmed the ambulance frequency and tones "just in case of an 'emergency'" -- Either way, I doubt the parents realized that the kids would find the ambulance frequency and decide it would be fun to interfere.

-----Original Message-----
From: Gary

I'm well aware of how tones work. You have to remember that most public service users don't. They simply want to hear what is related to their job. So radios are almost always programmed with tones enabled on the received as well as for transmitting. Thus most likely they would not have known what the interference was if the children's radios weren't also transmitting using the proper tone.

Spin it any way you want but I'd be willing to wager the radios had the proper transmit tones programmed in along with the correct transmit frequency.

I understand and agree.
I use Thunderbird also and I very rarely go to the Yahoo groups page.
The only time I go to the groups page is to search for something.
The problem is most people neglect to trim, when they do they trim to
much or not enough.

I have just purchased a UV-5R and have downloaded the programming software.

I have also purchased the USB adaptor cable and installed the drivers.

My OS is Windows 7.

When I attempt to read the radio (from BF5R) I get an error message "Fail Connect with transceiver".

In the Windows control panel I have examined the port devices and it shows the USB cable as "Prolific USB-to-Serial Comm Port (COM4)" shows the port to be operational.

In BF5R I have gone to "Communications" and set it to COM4.

Any thoughts?

Well I consider myself a trustworthy and mature person. :)
I would count myself as a child that likes to play with radios, but only cause I'm like a kid in a candy store. :)

Just so Jeff knows I have been a volunteer for a number of things in the past ~30years. I was a volunteer EMT for an ambulance corp in Upstate NY for almost 10 years before I moved to Tenn. If there were volunteer ambulances here you can bet I would be still doing it. But here in Tenn there is very few of those left, most first responders are a part of a Rescue company. I don't have the time or extra funds to go through all the different classes that Rescue companies want you to do. Unlike NY, Tenn doesn't help pay for certs for volunteers. Just to transfer my EMT license to Tenn would have cost me on the order of $600, which I can't afford to spare.

For what it's worth....

I have the Yahoo Mail premium (20 bucks a year) which allows me to
access my emails from Mailwasher Free, a fantastic program to sort your
good email from trash even before you download it to Thunderbird
You can download Mailwasher here
http://www.pcworld.com/article/231672/mailwasher_free.html

I run Mailwasher first. Then, and only then, do I download to
Thunderbird from Yahoo.

Thunderbird lets you set up as many folders and filters as you want to
automatically sort your email.

One of the neatest features of Thunderbird is that you can open an email
you have already sent and EDIT MESSAGE AS NEW and change addressees, for
example, without having to copy and paste the whole message into a new
email.

Sounds complicated, but it is a fantastic time-saver once you get it set up.

Once you work this way, you would never use Yahoo Mail or Hotmail as
your main email service...way too primitive.

I thought that too, but now I'm not sure. I'll explain why.

Here's what we know from the news report.

The boys were interfering with the "Lakewood Civilian Safety Watch". The LCSW is authorized by the FCC (WQKD260) to operate a 100 watt repeater on 463.48750/468.48750

http://wireless2.fcc.gov/UlsApp/UlsSearch/licenseFreqSum.jsp?licKey=3092220&printable

Note: According to this website, this repeater does use CTCSS (but I don't think CTCSS was being used by the boys)

http://www.chacha.com/question/what-is-the-vhf-frequency-for-lcsw-lakewood-civilian-safety-watch-of-lakewood

Both UV-5R radios shown in the news report were supposedly provided by an anonymous parent of one of the boys.

Both radios are shown to be in VFO mode. The LCSW frequency is in the lower display of both radios. You can not program memory channels from the lower display so it likely that the LCSW frequency is not programmed into a memory channel.

The upper display of the radio on the left is tuned to a frequency close to UHF ham repeater frequencies. The upper display of the radio on the right is tuned to a repeater frequency (461.98750/466.98750). The upper display is selected on both radios but neither radio is showing a + or - shift in the upper status display even they they are tuned to frequencies that are on or near repeater frequencies.

I feel that these boys didn't yet have an understanding of repeaters and what settings to change to be able to access them. It would be doubtful then if they knew anything about CTCSS (aka PL). At least neither of the upper displays show that a receive CTCSS tone has been programmed. The only way we could know for sure if either radio had a transmit CTCSS tone programmed would be if the news report showed the display of one of the radios while it was transmitting or while it was in reverse mode.

I now believe that these boys probably happened upon this active frequency while scanning on the lower VFO. They then transmitting in simplex mode on the output frequency of this repeater. I now feel that is is likely that one or more of the LCSW radios does not have receive CTCSS programmed in it.

But I can still be wrong...

Jim,

The one thing we really can't know is what the parents did with the radios before they were shown to the news crew that filmed the clip. Any number of changes could have been made, including the simple step of taking the radios out of channel mode and into frequency mode. I doubt the TV crew would ever have even though to check (or know how to check) if any frequencies were actually programmed into the radio.

Craig,

I agree. We really can't know.

But my feeling is that the parents know nothing about how to operate these radios. If they did, I would have expected the radios to have been switched to some other frequencies besides the LCSW frequency. The parents probably had no idea which frequency of the three displayed was the one used to cause the interference.

The upper display of the radio on the left is tuned to a frequency close to UHF ham repeater frequencies. The upper display of the radio on the right is tuned to a repeater frequency (461.98750/466.98750). The upper display is selected on both radios but neither radio is showing a + or - shift in the upper status display even they they are tuned to

frequencies that are on or near repeater frequencies.

I feel that these boys didn't yet have an understanding of repeaters and what settings to change to be able to access them. It would be doubtful then if they knew anything about CTCSS (aka PL). At least neither of the upper displays show that a receive CTCSS tone has been programmed. The only way we could know for sure if either radio had a transmit CTCSS tone programmed would be if the news report showed the display of one of the radios while it was transmitting or while it was in reverse mode.

I now believe that these boys probably happened upon this active frequency while scanning on the lower VFO. They then transmitting in simplex mode on the output frequency of this repeater. I now feel that is is likely that one or more of the LCSW radios does not have receive CTCSS programmed in it.

But I can still be wrong...

Hey, if we could get the emails for the kids maybe we could have them take over some of the programming support questions that always pop up week after week within this group (grin)?

Rather more than 3dB!

A 45 degree error will give you a 3dB loss; a 90 degree error
will give several tens of dB loss (in theory, infinite).

Not at all. Simply set up to receive email (either individual
messages or a digest) at the group site.

Thunderbird also has the option to put replies the right way up
so you can read top to bottom!

I have two UV5R units going on a year old.

One works fine the other does not disconnect the speaker when the headset is pluged in, the head set works but the radio speaker is still on.

Anyone see this before ?

From: Craig Carnahan
> You are correct, Gary. If the Motorola radios were programmed
> with PL on encode and decode, there would be very little chance
> that the kids accidentally caused interference.

Actually that is not completely true.

If the Ambulance company radios were using PL Decode (and the kids' radios were not using PL Encode), it would have reduced the "interference" in that the ambulance crews would not have heard the kids talking in between their own calls. But having someone else on the channel is not, in itself, really "interference." Interference comes when there are multiple users trying to transmit on the frequency at the same time. PL does absolutely nothing to eliminate or reduce this problem -- in fact, the use of PL Decode actually increases the likelihood of multiple users on the same channel trying to transmit at the same time because these users do not hear each other before transmitting.

Nothing in the original video ever described the kind of "interference" that was happening. Personally I suspect that there was no real interference at all, but that the kids were simply talking on the same frequency as the ambulance service using the radios that had been programmed with frequency and tone by the parents. When the ambulance service heard some kids yacking on "Their" channel, they had the local authorities look into the "interference" and found the kids.

The kids transmitting on the ambulance service frequency COULD have caused real interference, and under certain circumstances that interference COULD have been life threatening. But it is very unlikely that the local authorities would have dropped the entire matter with just a stern "Don't do that again" if there had been any danger.

36076. Re: [baofeng_uv5r] POP and IMAP email

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: Xaun Loc
Topic: 35842 Message: 36076

Yahoo’s POP and IMAP servers have always been unreliable in the past. When they moved them from “free” over to their joke of a “premium” email service years ago, there was little or indication that they got any better. If Yahoo has given up on trying to charge for POP and IMAP service, the only expectation is that the service will be totally without any support (like all Yahoo “free” services). I can’t expect that Yahoo’s POP or IMAP service will work any better now than it did before.

A far better solution is simply to have Yahoo Groups send your messages to a real email address – either at your ISP or through one of the other email services available. Of the non-ISP services available, so far I’d say that free gmail is probably the best value. Poor support (like all “free” services) but good enough documentation if you know how to set up either POP or IMAP; effectively unlimited bandwidth, no ads if you are using POP or IMAP, and webmail available as a backup if you have a problem or just need access without your email client.

> That may very well be true, but we'll never really know for sure.

There are three things we do know:

1. They were causing interference by transmitting on a frequency where they were not authorized.

2. They were found and identified -- quickly.

and

3. The incident got quite a bit of publicity. Which MIGHT still bring it to the attention of the FCC (who works much more slowly than the local cops)

Overall, a cautionary tale for the people who think using a radio makes them totally anonymous and ensures they can never be caught.

From: <jimvan_01@...>
Topic: 36082 Message: 36082

I guess I've been quiet long enough, and I think with all the back-and-forth that's been going on lately, I need to say something.

First, I'm not an amateur radio operator. I'm a part 90 user. I received my First Class Radiotelephone license in 1967 or so, and I retained it until the FCC stopped issuing first phone licenses. I was the communication unit leader for the county fire department where I lived until I retired. I'm currently a volunteer park host for the Parks and Rec department in the state where I live, and its in that capacity that I use my UV5R plus.

After doing some research, I decided that the 5R plus was the direction I wanted to go. I ordered my radio from Amazon, and began to research the literature. That research took me to this group and from here to the Miklor site. My radio was to arrive in about 3 days, and I spent those 3 days studying every bit of literature I could get my hands on, PARTICULARLY the Miklor site. When the radio arrived in the mail, I was ready. I had the radio programmed and I was on the air within 30 minutes of opening the package.

If I have any words of wisdom to pass along, it is simply this: Please, PLEASE read every piece of literature you can get your hands on, but especially the entire Miklor site BEFORE you open the box containing your radio, and especially before posting a question on this forum. IMHO, Miklor has all the info anybody could possibly need to know about the UV5R family, but you have to read it to get the answers.

Thanks for listening

Subject: [baofeng_uv5r] Another perspective

I guess I've been quiet long enough, and I think with all the back-and-forth that's been going on lately, I need to say something.

First, I'm not an amateur radio operator. I'm a part 90 user. I received my First Class Radiotelephone license in 1967 or so, and I retained it until the FCC stopped issuing first phone licenses. I was the communication unit leader for the county fire department where I lived until I retired. I'm currently a volunteer park host for the Parks and Rec department in the state where I live, and its in that capacity that I use my UV5R plus.

After doing some research, I decided that the 5R plus was the direction I wanted to go. I ordered my radio from Amazon, and began to research the literature. That research took me to this group and from here to the Miklor site. My radio was to arrive in about 3 days, and I spent those 3 days studying every bit of literature I could get my hands on, PARTICULARLY the Miklor site. When the radio arrived in the mail, I was ready. I had the radio programmed and I was on the air within 30 minutes of opening the package.

If I have any words of wisdom to pass along, it is simply this: Please, PLEASE read every piece of literature you can get your hands on, but especially the entire Miklor site BEFORE you open the box containing your radio, and especially before posting a question on this forum. IMHO, Miklor has all the info anybody could possibly need to know about the UV5R family, but you have to read it to get the answers.

Thanks for listening

This was my point when I stated that nobody wants to do just a little bit of research before asking a question that has been asked 17 times and just got done being asked and answered AGAIN. Check the websites and the bottom of EACH and EVERY email sent in this group and check the archives also. I am willing to help people with their questions and problems, but have a problem when they don't try to help themselves first. One local ham here asked me once "don't you know what an Elmer is for". I told him "Yes, they are to help you do things for yourself, not do it for you."

One recent poster said he just got his radio and software, "any ideas"? He didn't specify anything, or didn't ask about the radio or software. I was going to reply, "Well, I have to do laundry and the dishes. I think the universe is fascinating", etc. How are you supposed to answer that question?

I know not everyone is a ham, but it would be worth while to study a ham book or take a ham radio class. That way, they just might find out what tones are and how they are used, about what might be the best antenna, etc. These radios are great for hams that also work public safety, etc, where they might have a basic knowledge of radio, but recent posts show new buyers that want to use the radios for things they are not meant for or to use them at work without checking with whoever is in charge of the comms system, can be a real pia.

Not at all. I relied VERY heavily on the expertise and experience of this group's users. It was this group which referred me to the Miklor site which I found to be a very valuable information source in addition to the excellent information I gleaned from Baofeng users in this group.

My point was simply that a new user would do well to do some studying before posting questions.

The column in CHIRP is MHz so the correct entry for Offset would be 0.600000

Just for clarification, these boys were interfering with the Lakewood Civilian Safety Watch (LCSW), not the Hatzolah ambulance service who's captain was interviewed in this news report.

The television reporter likely added the "first responder interference" slant to the report to make it newsworthy. It probably would have never made it to air if it was "boys interfere with neighborhood watch group". Also, if anybody from the LCSW group was interviewed, they didn't make it to air either.

The report said that "in close to 10 cases this year, kids have interrupted emergency channels". It did not say that these boys were included in that statistic. My feeling is that they were probably involved in some of them.

Attachments: 1 described; binary payloads are missing from this source WARC

Three possibilities come to mind:

1. The radio has been modified to bypass the switching built in to the headphone jack

2. The headphone jack is faulty in a very strange way

3. A wire or other conductor has come in contact with the headphone jack shorting across the switch that should disconnect the internal speaker.

I have two UV5R units going on a year old.

One works fine the other does not disconnect the speaker when the headset is pluged in, the head set works but the radio speaker is still on.

Anyone see this before ?

The news media deliberately slanting a story? Say it isn't so, Jim. Why, the next thing you know we'll be hearing how those "if you want to keep your health insurance, you can" stories might have been a tad bit misleading too. Every day that goes by seems to reveal a new spin on a doctored story, and they wonder why fewer people than ever before trust the media or government politicians.

Hi Gord,

It is a common UV-5R issue to not get the plug seated in the speaker/mic jack all the way. You hear about it more with programming cables than you do speaker/mics and headsets. If either of the pins doesn't go in all the way, then it may not lift the respective contact to disconnect the internal speaker or internal microphone. In this case it is the smaller 2.5 MM pin with the issue.

Open the plastic cover over the speaker/mic jack and take a look. The holes are not centered in the rectangular recess. They are positioned closer to the rear of the radio and sometimes the shell of the plug contacts the rear side wall of the recess and this contact won't let the plug go in all the way without some extra wiggling and a firm push. Some have even had to shave some plastic off of the shell to get the plug to fully seat in the socket.

36097. RE: Antenna for marine VHF use

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-30 09:35:23 UTC
From: <keith_rhodes@...>
Topic: 36026 Message: 36097

You're right, Xuan, I'm in France, not the US so I'm not bound by the FCC regulations like most of you guys. And I entirely agree with you, that it up to each individual to ensure that he or she complies with local regulations.

I really appreciate the great degree of legal and technical knowledge that many members of the group have, and that's why I posted my request for information about the antenna. I don't expect or even hope to find people here with in-depth knowledge of EU, EFTA or French law, or for people here to spend time trying to figure it out for me. That's my responsibility.

After reading the replies, I started looking around and decided that it is probably not a good idea for me to transmit on marine VHF channels using the UV-5R; I've not been able to find out if it has type-approval in the EU and EFTA. There should be no problem using it to listen, though.

But looking more closely, I can't find the "Wheel Mark" (for type-approval) on my iCOM IC-M36, either. Now that might be because I bought it in the US, and it might have type-approval anyway. Time for me to head down to the local ham radio club and boating club, maybe to the Gendarmerie, and to ask more questions…

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

As everyone who has been here for more than a few days knows quite well, the UV-5R is only authorized for use under Part 90 and Part 97 in the United States. In the US, it is ILLEGAL to use this radio on frequencies regulated under Part 95 (FRS, MURS, GMRS) or Part 80 (Marine band).

Since you are in France, your use of the radio is not subject to FCC regulations, but Ray is in the US and his use of the radio is regulated by the FCC.

Your use of the radio in France is regulated by French government authorities. My French is a bit too rusty for me to get very far following the websites of the Agence Nationale des Frequences and the Association Française des Opérateurs Mobiles, so I’m not even going to try to guess what the rules are in your country.

This is an example of why it is important for people to know what country someone is operating in while trying to help them. Advice that is correct in one country can often lead to criminal misconduct in other countries. Many countries have rules that are somewhat less technical than those of the US, but at the same time, most of those countries have far stricter penalties for violating their rules. The $10,000 fines common in the US may seem serious to most people, but they are not as bad as jail time which are possible in many countries simply for possession of an unlicensed or unauthorized radio (especially one CAPABLE of operating on a government frequency)

From: keith_rhodes@... mailto:keith_rhodes@...

Xuan, what is the felony do you think that Ray might have comitted? Is it something about using a Baofeng UV-5R on marine VHF channels on a lake, rather than ocoastal waters, or is there something about FCC regulations that mean that the UV-5R should not be used like that?
I'm not in the US, so the FCC regulations don't affect me, and looking at the info I can find it seems that marine VHF transceivers are regulary in the 1W to 25W range, so a little 5W handheld shouldn't be a problem because of power… Maybe frequency accuracy? Or just is this unit not certified by the FCC for use on those frequencies?

Why should it be? In the UK, the emergency services have used
encrypted transmissions for several years with no problems at all.

> The bottom line? When police and fire comms as well as cell comms are down,
> ham radio will be used.

Yes, but using the ham kit with licensed operators. This is not
really relevant to the issue of the police &c comms being
encrypted. The only disadvantage of encryption is that it
prevents the earwiggers from listening in, and that's only a
disadvantage to those who wish to earwig.

I am writing this primarily to see if I have the correct address of BAOFENG User Group. My main rig won't acept AC and it has my Address Book In any event might as well comment while I am at it.

When my Mom got me my first ham radio after I got my Novice, the dealer would not sell it to her until she could show my licence. Many other mail order dealers had the same policy. When she brought me back to the store with ticket in hand, he wouldn't sell her the microphone that went with the radio until we brought in the Tech licence which I got the 30 days later. Way back then . . ., you had to wait 30 days to take the next test and it had to be at an FCC office or be be given by special examiner if you could not travel to an FCC location. VECS came later.

At one of our club meetings, a guy brought in an old YAESU that had an output of 160 Watts and would transmit on 11 meters. He said that earlier that day he put it on the 11 meter CB band and asked for a "Radio Check" and got a reply that said he was full scale. Dont Try This AT Home . . .

Facts may not be fully accurate as that was a long time ago.

This was my point when I stated that nobody wants to do just a little bit of research before asking a question that has been asked 17 times and just got done being asked and answered AGAIN. Check the websites and the bottom of EACH and EVERY email sent in this group and check the archives also. I am willing to help people with their questions and problems, but have a problem when they don't try to help themselves first. One local ham here asked me once "don't you know what an Elmer is for". I told him "Yes, they are to help you do things for yourself, not do it for you."

One recent poster said he just got his radio and software, "any ideas"? He didn't specify anything, or didn't ask about the radio or software. I was going to reply, "Well, I have to do laundry and the dishes. I think the universe is fascinating", etc. How are you supposed to answer that question?

I know not everyone is a ham, but it would be worth while to study a ham book or take a ham radio class. That way, they just might find out what tones are and how they are used, about what might be the best antenna, etc. These radios are great for hams that also work public safety, etc, where they might have a basic knowledge of radio, but recent posts show new buyers that want to use the radios for things they are not meant for or to use them at work without checking with whoever is in charge of the comms system, can be a real pia.

I guess I've been quiet long enough, and I think with all the back-and-forth that's been going on lately, I need to say something.

First, I'm not an amateur radio operator. I'm a part 90 user. I received my First Class Radiotelephone license in 1967 or so, and I retained it until the FCC stopped issuing first phone licenses. I was the communication unit leader for the county fire department where I lived until I retired. I'm currently a volunteer park host for the Parks and Rec department in the state where I live, and its in that capacity that I use my UV5R plus.

After doing some research, I decided that the 5R plus was the direction I wanted to go. I ordered my radio from Amazon, and began to research the literature. That research took me to this group and from here to the Miklor site. My radio was to arrive in about 3 days, and I spent those 3 days studying every bit of literature I could get my hands on, PARTICULARLY the Miklor site. When the radio arrived in the mail, I was ready. I had the radio programmed and I was on the air within 30 minutes of opening the package.

If I have any words of wisdom to pass along, it is simply this: Please, PLEASE read every piece of literature you can get your hands on, but especially the entire Miklor site BEFORE you open the box containing your radio, and especially before posting a question on this forum. IMHO, Miklor has all the info anybody could possibly need to know about the UV5R family, but you have to read it to get the answers.

Thanks for listening

I am writing this primarily to see if I have the correct address of BAOFENG User Group. My main rig won't acept AC and it has my Address Book In any event might as well comment while I am at it.

When my Mom got me my first ham radio after I got my Novice, the dealer would not sell it to her until she could show my licence. Many other mail order dealers had the same policy. When she brought me back to the store with ticket in hand, he wouldn't sell her the microphone that went with the radio until we brought in the Tech licence which I got the 30 days later. Way back then . . ., you had to wait 30 days to take the next test and it had to be at an FCC office or be be given by special examiner if you could not travel to an FCC location. VECS came later.

At one of our club meetings, a guy brought in an old YAESU that had an output of 160 Watts and would transmit on 11 meters. He said that earlier that day he put it on the 11 meter CB band and asked for a "Radio Check" and got a reply that said he was full scale. Dont Try This AT Home . . .

Facts may not be fully accurate as that was a long time ago.

I did read it again.

He says “formally WB3JNQ”

I’ve been licensed over 50 years, and that’s the first time I’ve heard of a “formal” callsign.

Well said. This is good practice all around.

It certainly helped me to be aware of the common issues and obstacles beforehand. Like Jim's above, my UV5R was ready to roll within minutes, even with a bogus cable.

I don't think there's anything wrong with having this user's group, or any user's group. But it'd be nice if people put [more] effort into a little research before asking questions for which the answers are already readily available.

People are serious when they say that "Google is your friend."

Subject: [baofeng_uv5r] Radios Capable Of Transmitting On Bands Other Than Amateur

I am writing this primarily to see if I have the correct address of BAOFENG User Group. My main rig won't acept AC and it has my Address Book In any event might as well comment while I am at it.

When my Mom got me my first ham radio after I got my Novice, the dealer would not sell it to her until she could show my licence. Many other mail order dealers had the same policy. When she brought me back to the store with ticket in hand, he wouldn't sell her the microphone that went with the radio until we brought in the Tech licence which I got the 30 days later. Way back then . . ., you had to wait 30 days to take the next test and it had

to be at an FCC office or be be given by special examiner if you could not travel to an FCC location. VECS came later.

At one of our club meetings, a guy brought in an old YAESU that had an output of 160 Watts and would transmit on 11 meters. He said that earlier that day he put it on the 11 meter CB band and asked for a "Radio Check" and got a reply that said he was full scale. Dont Try This AT Home . . .

Facts may not be fully accurate as that was a long time ago.

Your first response was humor. The second indicated seriousness, at least in print.

The exchange that transpired here is presented very academically here:
http://journal.media-culture.org.au/0008/email.php
and here, much more colloquially
http://www.marcandangel.com/2007/05/28/email-communication-problems-how-to-communicate-effectively/

It is not a question of which coast you live on.

This type of mis-communication rarely happens in person. "Body language"
and "non-verbal communication" usually fill in the gaps for
communication in person.

When I Googled "problems in email communication" I got 189,000,000 hits.
That tells us it is a big problem.

Regards,

Ed

There are too many people here that do not enjoy the humor that has come into our our language do to the use of the spellchecker.

Do not take personally the engineer type people who have no capability to see humor in our world and must correct everything they see.

I enjoyed your narrative and saw no reason to correct.

Thanks, Hans! Really!

Well I checked and the word was not typed correctly. To add to my confusion is the fact that the program that checks spelling reported that it no longer provides support for this language and all along, I thought I was typing in English. Computer also states that it is withholding some pictures to to protedt "this computer." It offered to let me view them if I would click on that message. I did and there are none. Go Figure!

Hi Barry

I have been in this post for the last 13 years.

I set network policy.

I have worked with the C.E.O and President for the last 20 years.

I hire and fire without asking.

I ‘m ask to attend all his family affairs .

So in a word “YES”

What makes you think this group would reflect badly on the business ?

Best regards,

Gord VA3GLK

The problem is the radios are so low priced.
I just found a store that is using them on a regular basis.
They know what they are and that they are not licensed and go farther
then they need to for their purpose.
They have no intention of getting any sort of license. ham or business.

I am writing this primarily to see if I have the correct address of BAOFENG User Group. My main rig won't acept AC and it has my Address Book In any event might as well comment while I am at it.

When my Mom got me my first ham radio after I got my Novice, the dealer would not sell it to her until she could show my licence. Many other mail order dealers had the same policy. When she brought me back to the store with ticket in hand, he wouldn't sell her the microphone that went with the radio until we brought in the Tech licence which I got the 30 days later. Way back then . . ., you had to wait 30 days to take the next test and it had to be at an FCC office or be be given by special examiner if you could not travel to an FCC location. VECS came later.

At one of our club meetings, a guy brought in an old YAESU that had an output of 160 Watts and would transmit on 11 meters. He said that earlier that day he put it on the 11 meter CB band and asked for a "Radio Check" and got a reply that said he was full scale. Dont Try This AT Home . . .

Facts may not be fully accurate as that was a long time ago.

Illegal ?? How so ? My radio has a part 90 certification sticker, and I use it while working as an agent of the license holder, and under his direct supervision and with his full knowledge and censent. Did I miss something in my research ?

Although you probably use the UV-5R in a proper manner you should be
aware it is still illegal to use that way.

The problem is not that they are low priced. It seems to me that the
problem might be that one can buy a field programmable radio without an
FCC license.

Field programmable radios have been around since Moby Dick was a minnow. Personally, I don't see much of a problem. Some kids in NJ were heard on a Part 90 frequency, the insignificant problem somehow got on TV on a slow news days, and now the IOoDHW (International Order of Dismayed Hand Wringers) are all spun up about "ain't it just awful".

DOS Hint: Licenses have nothing to do with it. Google "FCC cites ham for interfering with....". You'll find a host of examples, not of accidental operation by some dumb kids, but DELIBERATE malicious interference, false distress calls, and other criminal acts by FCC licensed hams. Most of their radios cost more than forty bucks too.

> Gendarmerie, and to ask more questions…

Having bought it in the US is the most likely reason for it to not have the European marking for marine band approval. We see that same situation here with the UV-5R very frequently, because radios shipped FROM THE FACTORY direct to dealers in the US get the US markings; but radios shipped from the factory to dealers in China get only the markings for Chinese approvals (oddly enough the Chinese approval label is printed in English!) Because many buyers in the US buy the radio from overseas sellers, they get the radio without US approval markings, and under US rules those radios cannot legally be used in services that require approval even thought the radio is physically identical to the approved radio. Even when a US buyer buys the radio from a seller in the US, he may still get one without the US markings if the radio was originally shipped by the factory to a wholesale dealer in China (or anywhere outside the US).

Because the marine channels are international in nature, you might be lucky and France might accept the US Type Approval for marine band. But overall it is a good example of why people who need various legal approvals on their radio need to be sure that the seller is going to provide a radio with the correct approval markings.

If it bothers you, figure out what frequency they are using and report it to the FCC. It may take them several months to get around to paying any attention to the situation. If they are using a ham frequency I would recommend getting assistance from some of the Official Observer volunteers in your area -- even if they are not using ham frequencies, a nearby OO might still be willing to help with the report.

So even though the set itself is approved, it must have the
relevant label to be legal?

I can see the situation occurring where someone has two radios,
one with the label and one without, and much public money being
wasted in proving he was using the wrong one.

Hi there.
I can't find on the literature thing saying I can't add/modify a tone to a existing channel, but in practice,I only managed so far to do so while in Frequency Mode.....
So,ex. I go to MR and menu #13 and add 141.3hz it won't save.
Am i wrong to think i can modify channel on menory....and i actually must go to VFO and modify it there on the same freq of the channel saved to memory?

thanks guys

Sent from my Xperia™ smartphone

If you want to change most options in an existing memory, you have to
delete the memory number, re-enter the changes, and then save the new
information.

That is the way that the regulations are written. Those rules were written long before there was a online database (or ANY electronic database) of the approved radios. The rules make the manufacturer responsible for properly marking the approved radios and allow the user to assume that a properly marked radio is really approved unless the FCC can show that the user "knew or should have known" that the radio had been modified and no longer qualified as approved. It is entirely possible that if a case were fought in court today, a judge MIGHT decide that a radio being listed in the approved database was sufficient (just as a ham callsign in the FCC database is valid for use weeks before the individual receives his or her paper license). Personally, I wouldn't want to bet my licenses on a questionable defense that would, at best, cost thousands in legal fees to win.

> I can see the situation occurring where someone has two
> radios, one with the label and one without, and much
> public money being wasted in proving he was using the
> wrong one.

That COULD happen but it seems unlikely - with transmitter fingerprinting it would generally be a simple enough matter to settle one way or the other -- and, despite the oft lamented "cost" of legal actions, the simple fact is that the government lawyers and other employees who handle such cases are already government employees so there is little or no real added cost to the "public money." The FCC rarely loses in any of the rare instances when they take a violation to court. One of the reasons that they work so slowly and cite relatively few violators is because they make a point to build an air tight case before they move beyond an inquiry.

I should add, I did get the proper driver working under windows 7 with the knockoff adapter I got on ebay, but yes it took a bit of trial and error. Never had a problem with chirp on Linux with any of the various cables and usb serial adapters I've bought whole or hacked together from parts. The live cd will not change anything on your computer. Just remove it and reboot.

36156. Baofeng UV-5R strange reception after monitoring for a few minutes

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-01 13:42:26 UTC
From: <wrbeaton@...>
Topic: 36156 Message: 36156

I don't know if this is just my Baofeng, or if this is common, but after monitoring a local repeater for a few minutes the audio becomes garbled and noisy and clears up if I move the radio a few inches in any direction! It will be fine for a while and then comes back until moving it again. This happens using the supplied rubber duck. Any ideas?

Sounds like multipath interference.

Question, do you know what “ghosting” means as with off air TV signals? I’m old enough to remember them well. If so, you can visually see what’s happening to the signal you’re receiving. For want of a better term, I call them “rays”, the individual bits of the signal which travel various paths to get to your radio’s antenna.

Some of these rays travel to your antenna directly and are usually the strongest. However, there are other ‘rays’ that bounce off buildings, water tanks, even large airplanes taking off and landing. Remember that the signal leaving an antenna is not perfectly, tightly focused, or aimed at you. Some of it takes off in other directions, these typically are the bits of signal that take the longer path to get to you.

These bounced rays arrive at your antenna slightly delayed when compared to the direct rays. If they arrive at exactly a time when they can detract from, or diminish the direct ray you can have the behavior you describe. It has to do with a measured phenomenon called phase, or phasing. Moving the radio changes the timing of the arriving signals (the rays) and your reception improves.

In the case of TV ghosting, you actually see the main ray (the actual picture) and the rays delayed by their taking the longer path (the ghost images to the right of the main image). This is a constantly varying phenomenon, affected by the ever changing environment. The only way to overcome it is to find a spot where only the strongest ray remains dominant.

A bigger antenna might fix the problem, or you may even need a directional antenna, like they used for TV, to aim at the best signal.

Subject: [baofeng_uv5r] Baofeng UV-5R strange reception after monitoring for a few minutes

I don't know if this is just my Baofeng, or if this is common, but after monitoring a local repeater for a few minutes the audio becomes garbled and noisy and clears up if I move the radio a few inches in any direction! It will be fine for a while and then comes back until moving it again. This happens using the supplied rubber duck. Any ideas?

As strange as that sounds, you're probably right (e.g. the DSP decoding becomes confused by the multiple out of phase signals).

Sounds like multipath interference.

Question, do you know what “ghosting” means as with off air TV signals? I’m old enough to remember them well. If so, you can visually see what’s happening to the signal you’re receiving. For want of a better term, I call them “rays”, the individual bits of the signal which travel various paths to get to your radio’s antenna.

Some of these rays travel to your antenna directly and are usually the strongest. However, there are other ‘rays’ that bounce off buildings, water tanks, even large airplanes taking off and landing. Remember that the signal leaving an antenna is not perfectly, tightly focused, or aimed at you. Some of it takes off in other directions, these typically are the bits of signal that take the longer path to get to you.

These bounced rays arrive at your antenna slightly delayed when compared to the direct rays. If they arrive at exactly a time when they can detract from, or diminish the direct ray you can have the behavior you describe. It has to do with a measured phenomenon called phase, or phasing. Hi all,
There has been a lot of reports about antennas here on the list.. Most state the difference in performance between one antenna and one or more others. However, very few mention on what frequency the radio was being operated on at the time. I have found that an antenna's performance may, and usually does, vary quite a bit between operation on VHF and UHF. My report, found at www.dacomp.com/baofeng.html shows what I have found in this respect. So please let us know on what band your were operating on when letting us know how good, or bad, an antenna is performing.
This is just a suggention, NOT an order. I don't wish to suggest that I know more than some of you experts. This is just a suggestion from a seventy-five year old ham with nothing better to do at the moment.

This could be either a known issue with this radio OR it could be a well known issue with HTs -- or possibly some combination. My own guess is that it is mostly the well know issue with any handheld (with perhaps just a little of the UV-5R issue added)

The problem is that your signal is barely strong enough to provide good audio to start with -- then your signal becomes slightly weaker which makes the audio noisy.

This COULD be caused by a known issue with many UV-5R radios were the components begin to overheat if you are transmitting too long on high power -- but if that was the problem, it is unlikely that moving the radio slightly would help very much -- but listening for a minute or so might allow enough time for the components to cool enough to give you full power again.

The more likely problem is that the signal reaching the repeater from ANY HT will vary if you move the HT even a few inches. As I mentioned at the start, clearly your signal is barely strong enough to give you good audio on that repeater to start with. While you are talking you will almost always move a little -- that can be enough to drop your signal strength and cause your audio to be noisy -- then when you deliberately move the radio you get a better position and a better path for your signal.

A better antenna might give you enough signal strength to stay solid in the repeater.

I think that maybe I wasn't clear in my original note. There is no transmitting involved on my part. I was referring to just listening. I have a very strong signal from the repeater and it still gets distorted and noisy after a few minutes which clears up after picking up the HT and moving it a few inches or even just putting my hand near the HT clears up the problem! Weird.

I believe menu item #3 is the battery save function. Is that what you were referring to?

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Hi walt try this see if it clears this up.go to menu #3 > menu again see if default is 3 if it is drop it to 1 or 2 start with1 first > menu confirm > exit see if this improves recieve if you get intermodulation increase menu 3 to the 2 position. i found after doing this the radio became less ensitive to antenna tilt dropping of signals.let me know how it worked for you also a better antenna should be used i put on a BNC adapter so I could use some better antennas I have.Good luck.Jim KB1PFL

This could be either a known issue with this radio OR it could be a well known issue with HTs -- or possibly some combination. My own guess is that it is mostly the well know issue with any handheld (with perhaps just a little of the UV-5R issue added)

The problem is that your signal is barely strong enough to provide good audio to start with -- then your signal becomes slightly weaker which makes the audio noisy.

This COULD be caused by a known issue with many UV-5R radios were the components begin to overheat if you are transmitting too long on high power -- but if that was the problem, it is unlikely that moving the radio slightly would help very much -- but listening for a minute or so might allow enough time for the components to cool enough to give you full power again.

The more likely problem is that the signal reaching the repeater from ANY HT will vary if you move the HT even a few inches. As I mentioned at the start, clearly your signal is barely strong enough to give you good audio on that repeater to start with. While you are talking you will almost always move a little -- that can be enough to drop your signal strength and cause your audio to be noisy -- then when you deliberately move the radio you get a better position and a better path for your signal.

A better antenna might give you enough signal strength to stay solid in the repeater.

I agree with Jardy, NOAA weather radio channels should be programmed with menu 5 (WN) set to WIDE.

But just for the fun of it, I programmed 2 channels with the NOAA frequency for my area, one set to WIDE and the other set to NARR. I then selected one in the [A] display and the other in the [B] display and switched between them with the [A/B] button. I couldn't hear any difference.

Are there any Mics for the UV-5R that is the Mic only? I am temporarily running my UV-5R mobile and would like to run a separate mic and external speaker rather that the all in one unit. I don't think the audio from the speaker in the mic would be any better (possibly worse?) than the speaker on the radio itself and I plan on running an external speaker. Any suggestions? Thank you. Hi Jon,

The external PTT switch makes a connection between the 3.5 MM pin's sleeve and the 2.5 MM pin's sleeve to put the radio in TX mode. This means that both pins are necessary for the microphone and PTT switch to function.

You would have to make up some kind of connector box that would plug into the radio and then have a jack for the speaker/mic and a jack for the speaker.

Another solution would be to connect the external speaker to the earphone jack that is present on some speaker/mics.

I used to have a couple of UV-5 radios when they first came out and they had all kinds of problems with the squelch no matter how high you would set it. That said I read that the new UV-5RA's were a lot better. So I just bought 2 from Radio Mart as I heard good things about them. As far as Baofeng and dual banders go. can anyone tell me the best radio they have? I am going to buy a couple more. I don't really use them for transmitting mostly scanning but very limited amount of frequencies as I know the scan rate is very slow. I actually bought them to either augment my present scanners or leave parked on a channel if something is going on

> is VERY loud, and the volume pot at its lowest still results in
> VERY loud volume. Defective radio or inexperienced operator?

From the description it sounds like a defective radio but it is hard to be sure what someone considers "VERY loud"

The one thing I would check before assuming that there is a problem with the radio is to check to see if you set the channel to Wide or Narrow bandwidth. The NOAA signal is wide bandwidth. If you have the radio set for Narrow band, the NOAA signal will be seen by the radio as being overly loud and distorted.

Even with the radio in Narrow band mode, you ought to be able to turn down the volume control to get the audio down to a reasonable level but that audio would still be distorted and the volume control would have to be set very low. A lot of volume controls don't work very well at the extreme low end of the range.

If you still have the audio "VERY loud" with the radio set for Wide band and the volume control turned down, then you probably have a radio with a bad volume control.

Without any idea of where you are located, I cannot suggest any other frequencies to check, but if you go to Google and simply search on [County-Name] County Frequencies you should find several websites that list frequencies in your area. Unfortunately even the busiest frequencies are usually dead more than they are live, which is why NOAA is typically the easiest way to check reception.

Indeed you did.
To qualify the radio has to be locked to prevent users programming
their own frequencies.

That is strange.

As others have suggested, multipath distortion is about all that comes to mind but it seems very odd that multipath distortion would arise so regularly after a few minutes in each position.

When multipath comes and goes, it is usually due to either the receiver moving past various objects large enough to reflect the signal or a large reflective object moving past the receiver - both of these are unusual but are occasionally experienced in an urban setting where the receiver is in a car moving between buildings or when a large truck happens to pass the receiver.

If the geometry is just right, multipath can occur when an airliner happens to fly over, giving the signal something to bounce off, but again that should not give a recurring effect like what you describe.

Does this happen on all signals or just on one specific signal?

To print, you can use CHIRP's Export function. Export as .csv, which can be opened either in Excel, which makes it easy to organize and then print, or, opened as a text file, which will need to be edited to eliminate unneeded information before printing. For a carry-around card, I make an Excel sheet from the full export that only has the Channel number, Name, Frequency (RPT out or Simplex) and for some, add a simple note or description. In CHIRP, i did try to do a "Select All" then "Copy" and tried to Paste that selection into a text editor. No go. CHIRP's Copy and Paste seems to only work for data within CHIRP.

Everyone sets up their memory channels differently. I organize mine first with 2 Meter freqs, with a group left blank for later adds or vacation/travel, then 70cm channels plus a gap. I leave a group from 101-127 for non-transmit "scanner" freqs, like local media, traffic choppers, NOAA WX etc.

I have my local repeater programmed into the UV-5R. Works well.

So, when in memory mode (not VFO), I can scroll through all of the menu items for that channel. However, when I scroll to the OFFSET, menu 26, I see "00.000".
Why don't I see the 00.600 offset that I programmed into this memory channel??
I thought that, when in memory mode, the menu would reflect the values that are programmed for that channel.
Comments, please.

Hi Karl,

Many CHIRP users export their channel data to a CSV file. The CSV file can be loaded into MS excel, LibreOffice Calc or any other application that is CSV file friendly to be further enhanced and printed out.

Another method that would allow you to not only print out your channel data, but your menu settings too, is the DOS command-line programming software called Baoclone.

https://code.google.com/p/baoclone/

Attached is a sample config file that is provided with the software. Just load it into a text editor (or wordprocessor using a mono-spaced font) to view and print it out. What is really cool is that you can edit this config file and write it back to the radio to make changes to the radio.

Hopefully Congrats on the test.

As for testing, like Xaun Loc said how do other stations come in. Beyond just random googling. There is also repeater book. If you want to make sure there is going to be something to hear, look up the local NTS stations in your area, they'll have NETs, dial in to a traffic net and see if how loud those people are.

To be honest, I got he external speaker / mic when I ordered my radio. For the $8.00 I spent on amazon, I was blown away by it. The audio out was great, it lacks the ear phone out bit though.

I can clip the external to my jacket, have the radio on in the car, and have my HT on at the same time. Then when i do broadcast, all I have to do is turn the car radio down for a minute.

Because you did NOT program an 0.6000 offset into the memory channel.

I know that you did not program that offset, because there is no way to program any offset into any memory channel of this radio (as is described in the documentation on the Miklor website and as gets answered here at least once a week!)

If you programmed the radio using Chirp, you might think you programmed in an offset because Chirp displays an offset; but the radio memory has no place to store any offset in memory channel mode. The radio stores the receive frequency and the transmit frequency separately, so no offset is needed or used.

You might also note that when you look at any repeater channel on the display in memory mode, at the top of the display you will see BOTH the plus and the minus sign. If you were in VFO mode you would see EITHER a plus OR a minus, indicating the direction of the offset. The display shows both the plus and the minus to indicate that it is using a stored transmit frequency, not any offset.

> I thought that, when in memory mode, the menu
>would reflect the values that are programmed for

That is EXACTLY what the menu is doing.

36205. Battery life

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-02 17:55:46 UTC

Topic: 36205 Message: 36205

I use a UV5R to monitor at MURS frequency at work. We have a couple of devices that sound a tone when activated and I have the honor of taking care of it. I have noticed that my battery life is way down as in it may last 7 hours out of an 8 hr shift. Transmit is disabled so don't even go there. I end up charging the radio overnight for us the next. I know we did a survey long time ago but couldn't find it. Question: How long has the regular battery been lasting in your radio under just monitoring conditions?

From: Xaun Loc
Topic: 36205 Message: 36206

The factors that impact battery life generally are:

1. The age and condition of the battery
2. The temperature of the battery.
3. How the battery has been charged
4. How much transmitting is involved.
5. How much receive audio is involved.
6. The volume used for receive audio

Your description seems to indicate a situation where the battery ought to last a long time – for the OEM battery in good condition and fully charged, I would expect it to last at least a full 8 hour shift unless there is a LOT of receive audio and done at high volume.

You might need to check your battery charger to ensure it is fully charging the battery. If the battery is over a year old, it might be starting to wear out.

yes it is the battery save on recieve function .Beleive it or not adjusting this at least on mine improved recieve and dropped signals loss this function delays the opening of squelch there by saving battery power i just switched light on time interval to make up for any loss with the adjustment of the battery save menu #3.jim KB1PFL

---In baofeng_uv5r@yahoogroups.com, <wrbeaton@...> wrote:

I believe menu item #3 is the battery save function. Is that what you were referring to?

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Hi walt try this see if it clears this up.go to menu #3 > menu again see if default is 3 if it is drop it to 1 or 2 start with1 first > menu confirm > exit see if this improves recieve if you get intermodulation increase menu 3 to the 2 position. i found after doing this the radio became less ensitive to antenna tilt dropping of signals.let me know how it worked for you also a better antenna should be used i put on a BNC adapter so I could use some better antennas I have.Good luck.Jim KB1PFL

---In baofeng_uv5r@yahoogroups.com, <wrbeaton@...> wrote:

I think that maybe I wasn't clear in my original note. There is no transmitting involved on my part. I was referring to just listening. I have a very strong signal from the repeater and it still gets distorted and noisy after a few minutes which clears up after picking up the HT and moving it a few inches or even just putting my hand near the HT clears up the problem! Weird.

> and then comes back until moving it again. This happens
> using the supplied rubber duck. Any ideas?

This could be either a known issue with this radio OR it could be a well known issue with HTs -- or possibly some combination. My own guess is that it is mostly the well know issue with any handheld (with perhaps just a little of the UV-5R issue added)

The problem is that your signal is barely strong enough to provide good audio to start with -- then your signal becomes slightly weaker which makes the audio noisy.

This COULD be caused by a known issue with many UV-5R radios were the components begin to overheat if you are transmitting too long on high power -- but if that was the problem, it is unlikely that moving the radio slightly would help very much -- but listening for a minute or so might allow enough time for the components to cool enough to give you full power again.

The more likely problem is that the signal reaching the repeater from ANY HT will vary if you move the HT even a few inches. As I mentioned at the start, clearly your signal is barely strong enough to give you good audio on that repeater to start with. While you are talking you will almost always move a little -- that can be enough to drop your signal strength and cause your audio to be noisy -- then when you deliberately move the radio you get a better position and a better path for your signal.

A better antenna might give you enough signal strength to stay solid in the repeater.

It means, as I have stated on a couple of occasions now, that there is a problem with how your email client is interpreting the text sent by the "new,improved" Yahoo Groups system. Go complain to them about about it, and leave us out of it.

Speakers are a really personal experience.

But one like this

http://www.ebay.com/itm/Mini-External-Speaker-NAGOYA-NSP-150V-For-Mobile-Radios-Kenwood-Icom-Yaesu-/200953414248?_trksid=p2054897.l4275

Or here:

http://www.planetheadset.com/replacement-parts.php

And then build your own 2.5mm extension cable to plug in any Kenwood-compatible mic.

Jon KF5WUF

Hi Jon,

The external PTT switch makes a connection between the 3.5 MM pin's sleeve and the 2.5 MM pin's sleeve to put the radio in TX mode. This means that both pins are necessary for the microphone and PTT switch to function.

You would have to make up some kind of connector box that would plug into the radio and then have a jack for the speaker/mic and a jack for the speaker.

Another solution would be to connect the external speaker to the earphone jack that is present on some speaker/mics.

Have to apologize for this one..does take a connection on both jacks to use push-to-talk.

Still not a hard cable to build though.

You could just take a standard Baofeng Mic and split out the speaker wires.

Gentlemen;

Also, users of CHIRP, how do you organize you channels to make since to you, or do you just add them in kind of like I have been doing? Thanks, 73, Karl, KO8S
==========

I set up a plan on my other radio and carried most of it over to the Baofengs. Here is what is on my and the wife's Baofeng UV-5R's
0-15 VHF Repeaters (16-19 currently empty),
20-46 VHF Simplex along this plan http://www.hamuniverse.com/simplexoperating.html, 47-49 empty,
50-66 UHF Repeaters, (67-69 currently empty),
70-91 UHF Simplex, 92-105 empty,
105-109 Railroad <Listen only "Duplex off">, 110-125 empty,
126 is for my local cross-band repeater and 127 for a link to the local VHF repeater through my cross-band repeater. I have not really tested these last two and do not have permission for the last and will be deleteing it the next time I reprogram the radio.
Some of the repeaters are not in range from home, but should be when I travel in that direction. Many are not tested and may even be paper repeaters.

Anything beyond the basic ASCII characters are always questionable with a
wide mix of email clients and especially when that wide mix of clients also
has an intermediate step like Yahoo thrown into the mix.

The ubiquitous nature of Windoze has given us a generation of Internet users
who think that any sort of strange fonts, graphics, and other weird effects
ought to somehow magically work on everyone elseâ□□s system. These people
have been lured by the false promise of WYSIWYG â□□ a promise that if often
false even within Windoze as various programmers constantly choose to
â□□extendâ□□ their capabilities beyond each newly evolved standard.

It is all but impossible to find a mainstream email client today that does
not include capabilities that go far beyond any legitimate standards â□□ there
is no need for anyone to use these extended capabilities, but most email
clients default to making them available and fail to indicate which options
are questionable -- many email clients give users the impression that they
can set background colors and textures, select fonts, add graphic emoticons
(not just text based ones), and even include animations, all without any
hint that such nonsense is both a total waste of bandwidth and unlikely to
work reliably on other systems.

All business email clients have the capability to convert incoming email to
plain text. Most serious businesses require their employees to implement
this feature because it strips out many potential threats. There are also
many people who choose to implement a "plain text only" option to improve
the safety of their own system.

Despite the wide availability of all sort of bells and whistles, the simple
fact is that only the basic ASCII character set are consistently standard
across computers using the Roman alphabet. These characters can each be
represented with seven bits (limiting the number of such characters to 128
possible characters). The concept of allocating 7 bits per character has
its roots in the notion of one Byte per character with one of the 8 bits in
each byte being reserved as a parity bit for minimal error checking.

But 128 possible characters just didn't satisfy everyone (especially since many of those possible combinations were needed for control characters like the Carriage Return, the Line Feed, and the Bell "characters" -- the next step was to eliminate parity and use all 8 bits to represent unique characters, this doubled the number of possible characters to 256 which made some international characters available as well as a number of graphics used primarily for drawing boxes and borders. Most computers will show a double line box below this paragraph but some will show garbage.
â□□â□□â□□â□□
â□□â□□â□□â□□
The first 8-bit character set in wide usage was implemented by IBM on the original IBM PC and copied on all "PC compatible" systems. Meanwhile Apple introduced a slightly different 8-bit character set and DEC introduced yet another slightly different 8-bit set on their popular line of computer terminals. Eventually the International Standards Organization released standard ISO 8859 describing its own set of eight-bit ASCII extensions. Despite the notion that this was an international standard, there were actually different versions of ISO 8859 for different languages and alphabets such as Roman, Eastern European and Cyrillic.

For any of the 8-bit character sets is was generally necessary to identify the character set or code page being used. For email and HTTP, the character encoding of content was to be tagged with IANA-assigned character set identifiers.

Then came UNICODE which was the first somewhat-standard multi-byte character encoding scheme. Unicode can be implemented by different character encodings. The most commonly used encodings are UTF-8 and UTF-16. UTF-8 uses one byte for any ASCII characters, which have the same code values in both UTF-8 and ASCII encoding, and up to four bytes for other characters. The first 256 code points were made identical to the content of ISO-8859-1 so as to make it trivial to convert existing western text. The first volume of the Unicode standard was published in October 1991. (October 1991 is before many users here were born, but it is still recent even within the history of personal computers!)

Which then brings us to email and MIME.

Multipurpose Internet Mail Extensions (MIME) is an Internet standard that extends the format of email to support: Text in character sets other than ASCII; Non-text attachments; Message bodies with multiple parts; and Header information in non-ASCII character sets. MIME defines two different mechanisms for encoding non-ASCII characters in email, depending on whether the characters are in email headers (such as the "Subject:"), or in the text body of the message; in both cases, the original character set is identified as well as a transfer encoding. For email transmission of Unicode the UTF-8 character set and the Base64 or the Quoted-printable transfer encoding are recommended, depending on whether much of the message consists of ASCII-characters. The details of the two different mechanisms are specified in the MIME standards and generally are hidden from users of email software.

The adoption of Unicode in email has been very slow. Some East-Asian text is still encoded in encodings such as ISO-2022, and some devices, such as mobile phones, still cannot handle Unicode data correctly. Support has been improving however. Many major free mail providers such as Yahoo, Google (Gmail), and Microsoft (Hotmail) support it.

  Your appear to be shouting at us.

Try a more conversational tone with a normal font size (10) and weight. I do not see it as Courier New. It appears as a san serif font in Gmail.

At least it's not all in caps.

I am having a problem with my device. It appears I can no longer write data to the device using VIP. I have the correct COM ports set, and I get no error message, it just sits there and does nothing. I also cannot reset the device (MENU 40) it just wont let me. I have an image file that I use with CHIRP and a data file I use with VIP and I have been swapping them around when necessary, but VIP appears to have stopped working. Can anyone offer some advice ?

You can get usb to serial adapters fairly cheap...once in a while you get one that is a pain to find the right com port to get it to work, but once you get it figured out, it's a piece of cake after that.

Hopefully Congrats on the test.

As for testing, like Xaun Loc said how do other stations come in. Beyond just random googling. There is also repeater book. If you want to make sure there is going to be something to hear, look up the local NTS stations in your area, they'll have NETs, dial in to a traffic net and see if how loud those people are.

Chris,
What is the Firmware release of your UV-82L ?

- Power the radio OFF.
- Press and Hold the 5 key.
- Power the radio ON.
The display will show the Firmware release.

One more time: http://sourceforge.net/projects/chirplivecd/

Linux has never failed. Live cd makes no changes to your existing computer setup.

"One more time"? It doesn't matter how many times such a cryptic statement is made, the usual cause of "failure" with any liveCD is the computer's inability to boot from CD/DVD before the local physical drive, due to BIOS settings. Most users don't have the desire or patience to learn how to make the BIOS settings change that's needed, nor do they remember that they must actually reboot the computer with the CD/DVD in the drive after the BIOS is configured properly.

Usually, they just insert the CD/DVD in the drive and expect things to happen properly.

Thanks Xaun, I think I may just upgrade the battery to the 3600MAh. To answer the questions

1. The age and condition of the battery -- no more than 6 months, so almost new
2. The temperature of the battery. -- room temp
3. How the battery has been charged -- overnight in std charger
4. How much transmitting is involved. -- none
5. How much receive audio is involved.-- working freq at store, so lots
6. The volume used for receive audio -- have to turn it up at day goes by

Google finds the datasheet on the part.
http://monitor.espec.ws/files/sc6038_dual_cell_charger_121.pdf

The manufacturer appears to be Suncore or Shenzen morning core Microelectics Co, at http://www.scsuncore.com/Index/index.html.

They are a mainland Chinese company. I didn’t see any email addresses on the website.

I didn’t see any of the usual suspects offering to sell the part. A shame, really: if the datasheet is to be believed, it is a nice part.

You MIGHT try a very polite letter to the company. It can’t hurt, and might yield good results.

Hi Richard,

I assume that you are using Windows Vista, 7 or 8? Which driver do you have installed for the chip in your programming cable?

Back in April of 2012 when I got my UV-5R, I learned from the group that Prolific had added code to their driver that detected unauthorized copies of their USB-to-Serial chip. When detected, the driver would generate an error and refuse to work. In order to get a programming cable that contained an unauthorized chip copy to work, an older driver, without the detection code, was required.

In May of 2012, I installed and tried out just about every Prolific driver that I could get my hands on in an effort to determine what would be the absolute latest version that would work with an unauthorized copy of a Prolific chip. So using my Windows 7 64-bit computer, I started with the latest available driver and kept installing the next older version one-by-one until I could plug in my programming cable without an error showing up in Device Manager.

When I got to v3.3.2.105, I thought the quest was over. CHIRP worked great. But later, when I tried the Baofeng software (CPS and VIP), I discovered that neither would work. Apparently something was not compatible between the Prolific device driver and the programming language that Baofeng used for writing the UV-5R programming software.

So I continued installing and trying even older Prolific driver versions until the Baofeng software began to work. That happened when I installed the Prolific v3.2.0.0 driver.

So v3.2.0.0 is the driver version that I have been recommending for anyone using a Prolific chip based programming cable (genuine or not) with Windows Vista, 7 or 8. For Window XP, I recommend the Prolific v2.0.2.1 driver.

Thanks Stan,

Your explanation certainly sounds reasonable....and yes I am old enough to remember TV ghosting. I do think that this condition is somehow exaggerated with this particular unit as I didn't find anyone else noticing the same thing. I may have to buy another one to compare! Otherwise, it's a great radio for the price.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Sounds like multipath interference.

Question, do you know what “ghosting” means as with off air TV signals? I’m old enough to remember them well. If so, you can visually see what’s happening to the signal you’re receiving. For want of a better term, I call them “rays”, the individual bits of the signal which travel various paths to get to your radio’s antenna.

Some of these rays travel to your antenna directly and are usually the strongest. However, there are other ‘rays’ that bounce off buildings, water tanks, even large airplanes taking off and landing. Remember that the signal leaving an antenna is not perfectly, tightly focused, or aimed at you. Some of it takes off in other directions, these typically are the bits of signal that take the longer path to get to you.

These bounced rays arrive at your antenna slightly delayed when compared to the direct rays. If they arrive at exactly a time when they can detract from, or diminish the direct ray you can have the behavior you describe. It has to do with a measured phenomenon called phase, or phasing. Moving the radio changes the timing of the arriving signals (the rays) and your reception improves.

In the case of TV ghosting, you actually see the main ray (the actual picture) and the rays delayed by their taking the longer path (the ghost images to the right of the main image). This is a constantly varying phenomenon, affected by the ever changing environment. The only way to overcome it is to find a spot where only the strongest ray remains dominant.

A bigger antenna might fix the problem, or you may even need a directional antenna, like they used for TV, to aim at the best signal.

Subject: [baofeng_uv5r] Baofeng UV-5R strange reception after monitoring for a few minutes

I don't know if this is just my Baofeng, or if this is common, but after monitoring a local repeater for a few minutes the audio becomes garbled and noisy and clears up if I move the radio a few inches in any direction! It will be fine for a while and then comes back until

moving it again. This happens using the supplied rubber duck. Any ideas?

There is nothing wrong with fixing the charger if you can find locate the
IC. But you can purchase a replacement charging cradle for less than $5
(including shipping).

Hi Richard,

The reason is because both .CHIRP and .CSV format files are used to export from CHIRP. They do not include any detail about the particular radio that the data was exported from. The .IMG file is the native format for saving the channels and settings data from a particular radio model.

Only when the tab displays "Baofeng UV-5R: (Untitled)" or "Baofeng UV-5R: {some_file_name_here}.img", can the tab be uploaded to a UV-5R type radio.

So when you import a .CHIRP or .CSV file, you have to merge it into a tab as specified above (download from the radio or load a corresponding .IMG file to get one). Only then, will you be able to upload the data into the radio.

NO email client will consistently display incoming messages in exactly the fonts that the sender used <PERIOD>

Every client (and every operating system) substitutes a locally available font for whatever the file indicates as the font and characteristics. Some clients will try to match the characteristics, other clients will substitute a default font if they don’t have an exact match, and some may or may not apply characteristics such as bold, italic, underline, etc.

Then, regardless of whatever the email client and operating system have done, each person reading the text has his or her own ideas about it. For example, ALL CAPS, use sparingly is universally recognized as emphasis; BUT UNTIL TODAY I WOULD HAVE SAID THAT ALL CAPS USED EXCESSIVELY IS UNIVERSALLY RECOGNIZED AS “SHOUTING” – of course today I found that there is at least one person in the world who thinks that any bold font must be “shouting.”

Rob, since you are using the webmail interface for Gmail, you are stuck with whatever font substitutions Gmail chooses to make for you. At a quick glance it looks like Gmail web interface may well be substituting what Windoze calls “Arial” (although it might be Helvetica, I didn’t compare enough text to really be sure). If you switch to a real email client, you can usually choose whatever font you like for your incoming and outgoing emails.

Your appear to be shouting at us.

Try a more conversational tone with a normal font size (10) and weight. I do not see it as Courier New. It appears as a san serif font in Gmail.

At least it's not all in caps.

Hi Gary,

Unfortunately there is no capability built into the UV-5R for removing from and then later adding back to the scan_add list from the keypad. The only practical way to do this is by using programming software.

Topic: 36175 Message: 36257

One problem with both the various online frequency lists AND repeater book is that ALL such lists typically include quite a few frequencies that are totally unused.

An additional problem with Repeater Book for this purpose is that it includes only ham repeaters. Most ham repeaters have relatively low usage with only one or two busy periods each day (plus occasional traffic at random times. For ham repeaters the best bet is to try to monitor a scheduled net as rattis suggested, but it is harder to "look up the local NTS stations in your area" than to find the frequencies of public safety agencies or commercial users in an area. Unless you know where to look, trying to find ham net information isn't all that easy. The ARRL website has what they think is a "Net Directory" which you can search -- but the search assumes that the person knows a lot more about the NTS system and the ARRL field organization than most new hams are likely to know. You have to select the type of net and the ARRL Section (oddly enough, the form asks for the ARRL Section but the actual choices offered in the drop down menu are states not sections which does make it a bit easier). Assuming that you choose "Local Nets" you will get a list of all the "local" nets in your state - SOME of the net names will indicate where the net is located but many are "ARES District #" nets or Club nets with names that won't tell a new ham where the net is located. The list is also woefully incomplete (which is not the ARRL's fault)

From: James PapawTommie Hinman

If you have a smart phone, download the app,"Repeater Book" it will let you choose the range in miles and show you all repeaters anywhere you are

From: rattis@...

Hopefully Congrats on the test.

As for testing, like Xaun Loc said how do other stations come in. Beyond just random googling. There is also repeater book. If you want to make sure there is going to be something to hear, look up the local NTS stations in your area, they'll have NETs, dial in to a traffic net and see if how loud those people are.

==========

I set up a plan on my other radio and carried most of it over to the Baofengs. Here is what is on my and the wife's Baofeng UV-5R's
0-15 VHF Repeaters (16-19 currently empty),
20-46 VHF Simplex along this plan http://www.hamuniverse.com/simplexoperating.html, 47-49 empty,
50-66 UHF Repeaters, (67-69 currently empty),
70-91 UHF Simplex, 92-105 empty,
105-109 Railroad <Listen only "Duplex off">, 110-125 empty,
126 is for my local cross-band repeater and 127 for a link to the local VHF repeater through my cross-band repeater. I have not really tested these last two and do not have permission for the last and will be deleteing it the next time I reprogram the radio.
Some of the repeaters are not in range from home, but should be when I travel in that direction. Many are not tested and may even be paper repeaters.

Thanks all. Yes, I found the datasheet, and a couple of schematics for the charger. It really sounds like a great little IC for charging 2 Li-Ion cells. I also got another whole charger, because I burned up the first one by using the wrong wall-wart! Ugh! It went up in a smelly ball of smoke. (For the curious, the wall wart for the Batteries America EMS30K charger for the Kenwood D7Ag HT battery is reverse polarity from all others in my house! Same size plug as the Baofeng charger.)

http://monitor.espec.ws/files/sc6038_dual_cell_charger_121.pdf

The manufacturer appears to be Suncore or Shenzen morning core Microelectics Co, at http://www.scsuncore.com/Index/index.html http://www.scsuncore.com/Index/index.html.

They are a mainland Chinese company. I didn’t see any email addresses on the website.

I didn’t see any of the usual suspects offering to sell the part. A shame, really: if the datasheet is to be believed, it is a nice part.

You MIGHT try a very polite letter to the company. It can’t hurt, and might yield good results.

More techniques...

Here is what I wound up doing...

1. Download your local repeaters listed by proximity from http://www.repeaterbook.com/ to your computer in an Excel or CSV type file.

2. Open the spreadsheet in Excel...I wanted the LOCATION (instead of call signs) to show up in my UV-5R display, so I replaced the B column (Name, with call signs) with the M column (Comments, with Locations)...don't replace the headers, just the content under the headers.

3. Then I wanted the list to be alphabetical, so I did a DATA SORT in Excel and it arranged the list of repeaters alphabetically for me.

4. Always RESORT the A column (resort JUST column A) last after the DATA SORT so the items will show up in the correct sequence. Don't forget to SAVE these files.

5. Next, I downloaded the memory from the UV-5R to Chirp.

6. Then, I imported the saved CSV file and replaced the contents of the UV-5R in Chirp.

8. Finally, I uploaded the new contents from Chirp back to the UV-5R.

9. I ran through the new channels and everything was in order. When I am mobile, I can activate SCAN in channel mode and see if any repeater is active, and the display shows me the location.

To save time for future editing, I created several different CSV files, such as "by frequency", "by call sign", "by location", "VHF", "UHF", "Marine VHF", etc. Of course you can print these out if you want to have a paper reference.

You can cut and paste as you need to customize in Excel before you re-upload to the radio.

Sounds a bit complex, but once you get the sequence, it goes extremely fast...you would never want to do this manually.

Important tip: don't forget to save the CSV files first. Once or twice when I uploaded a new file, changes did not show up in the radio, because I had not saved the file first.

NOTE: I composed this email sequence of steps from memory on what I did a week or so ago...I think it is correct. If you experience anything wildly wrong, please let me know.

The reason for the "unused" pairs is that they have been assigned but the group that got them never put up a machine. My understanding is that all VHF repeater pairs in northern NJ are assigned but few are in use in my area.

Some of the repeaters are not in range from home, but should be when I travel in that direction. Many are not tested and may even be paper repeaters.

36264. Baofeng/Tonfa UV-985

I'm so addicted to the Baofeng radios, I already have the original UV-5R, UV-5RA, UV5RE Plus, and just received a couple of the UV-5R 8W (Tonfa) UV-985's. OK, so it says TONFA on the box, But I'm sure it is made by Baofeng. I've only had it a couple of days, but depending on the frequency, it does transmit between 6-10 watts. Has anyone else tried these units?

Just taking a quick look I dont see any FCC part 15 certification markings
or any FCC markings at all. I would not risk my ham license, my job or my
finances on this one... Not at all.

Yes, that is the way it downloaded for me. I just looked at my Excel files and the locations are listed in column M...it did the same for VHF repeaters and UHF repeaters. I don't have a "skip" column.

Doesn't really matter....

In any case, whichever column has the locations of the repeaters...that is the column you want to copy and insert in column B.

Apparently when you upload the Chirp file, the radio uses the first column (Column A...the header for this says Location...don't be confused by this...I assume it means "location in the sequence") to sequence the items, which is why the sequence needs to be from 1 to xxx, and it uses Column B for that channel's display...and what I wanted was the actual location.

From: the65gto
Topic: 36264 Message: 36267

Greetings, New to the group and the Baofeng radio. I do not quite have it figured out yet, but was able to D/L and install CHIRP. I feel really fortunate that I was also able to configure the usb cable and read from my radio. Have exported that file to an excel file. I notice that the columns are not in the same sequence but I can work around that. My radio file has channels 1-21 with “data”. I do not remember saving them, maybe it is automatic? Some of the tones are 69.3, 91.5.136.5,and 241.8? DTCS codes are 23, 25,134,274 etc. Would appreciate if I could get a good link on typical programming for vhf/uhf showing the correct type data. OR you could just type it in line either in the radio format or excel order. Tx

Mike, N4OZC

Ok understand all of that. There is not a “SKIP” header in the radio file, but when saved to an excel file, the sequence A=Location, B=Name…. K=Mode, L=TStep and M=Skip.?? Column A-Q total.

Subject: Re: [baofeng_uv5r] Print CHIRP settings

More techniques...

Here is what I wound up doing...

1. Download your local repeaters listed by proximity from http://www.repeaterbook.com/ to your computer in an Excel or CSV type file.

2. Open the spreadsheet in Excel...I wanted the LOCATION (instead of call signs) to show up in my UV-5R display, so I replaced the B column (Name, with call signs) with the M column (Comments, with Locations)...don't replace the headers, just the content under the headers.

3. Then I wanted the list to be alphabetical, so I did a DATA SORT in Excel and it arranged the list of repeaters alphabetically for me.

4. Always RESORT the A column (resort JUST column A) last after the DATA SORT so the items will show up in the correct sequence. Don't forget to SAVE these files.

5. Next, I downloaded the memory from the UV-5R to Chirp.

6. Then, I imported the saved CSV file and replaced the contents of the UV-5R in Chirp.

8. Finally, I uploaded the new contents from Chirp back to the UV-5R.

9. I ran through the new channels and everything was in order. When I am mobile, I can activate SCAN in channel mode and see if any repeater is active, and the display shows me the location.

To save time for future editing, I created several different CSV files, such as "by frequency", "by call sign", "by location", "VHF", "UHF", "Marine VHF", etc. Of course you can print these out if you want to have a paper reference.

You can cut and paste as you need to customize in Excel before you re-upload to the radio.

Sounds a bit complex, but once you get the sequence, it goes extremely fast...you would never want to do this manually.

Important tip: don't forget to save the CSV files first. Once or twice when I uploaded a new file, changes did not show up in the radio, because I had not saved the file first.

NOTE: I composed this email sequence of steps from memory on what I did a week or so ago...I think it is correct. If you experience anything wildly wrong, please let me know.

Regards,
Ed

Gentlemen;

Also, users of CHIRP, how do you organize you channels to make since to you, or do you just add them in kind of like I have been doing? Thanks, 73, Karl, KO8S
==========

I set up a plan on my other radio and carried most of it over to the Baofengs. Here is what is on my and the wife's Baofeng UV-5R's
0-15 VHF Repeaters (16-19 currently empty),
20-46 VHF Simplex along this plan http://www.hamuniverse.com/simplexoperating.html, 47-49 empty,
50-66 UHF Repeaters, (67-69 currently empty),
70-91 UHF Simplex, 92-105 empty,
105-109 Railroad <Listen only "Duplex off">, 110-125 empty,
126 is for my local cross-band repeater and 127 for a link to the local VHF repeater through my cross-band repeater. I have not really tested these last two and do not have permission for the last and will be deleteing it the next time I reprogram the radio.
Some of the repeaters are not in range from home, but should be when I travel in that direction. Many are not tested and may even be paper repeaters.

Hmmmm...if I understand it correctly, you are talking about a file which was downloaded from the radio which has an "M=Skip.??" column. I never noticed that when I downloaded to Chirp from the radio...it may very well be there...maybe from the factory?...so far it has not mattered.

However, I was talking about the file created by downloading from http://www.repeaterbook.com/...this file has the M column with locations of the repeaters listed.

After copying this list over to Column B and sorting the spreadsheet, I imported it to Chirp and then uploaded to the radio...without any "M=Skip.??"

Here is a portion of one of my edited files

Topic: 36264 Message: 36272

I have looked at a few sites regarding this unit...it appears to be a replica of the UV-5R.

It is not listed anywhere on the FCC web site.

I seriously doubt it puts out 8W.

Even our beloved UV-5R is only rated at UNDER 2W by the German lab that tested if for FCC certification. Here is the link https://apps.fcc.gov/oetcf/tcb/reports/Tcb731GrantForm.cfm?mode=COPY&RequestTimeout=500&tcb_code=&application_id=392511&fcc_id=ZP5BF-5R

Note that the FCC identifier is ZP5BF-5R...ZP5 identifies the company in China and BF-5R identifies the UV-5R (you can find this in the other documentation on the FCC site)

Having said that, as we all know, amateur operations are covered by Part 97 and Part 97 does not license/authorize/certify equipment (other than high powered amplifiers)...it licenses the operator. So, as long as you use this unit on amateur frequencies you should be OK.

Enjoy

Jim,

It is becoming clearer.

What you say is correct re headers, IF you start with a Chirp generated CSV file, because that is the way Chirp is laid out. The CSV spreadsheet from http://www.repeaterbook.com/ is laid out differently.

However, the Chirp program is rather smart...I just went and looked at my Chirp files...when I imported the CSV files which I had downloaded and edited from http://www.repeaterbook.com/ it took and repositioned the FREQUENCY and NAME columns, as well as the most of the other columns. It also deleted the location names that I had left in Column M. It must somehow recognize the HEADER names.

Pretty cool.

Hmmm, you are correct about the UV-985 being one of the earliest of the UV-5R series, but (not that it`s correct), the manual states: Output power + VHF:8W/2W UHF:8W/2W. I'm sure you are probably correct though. It's just another one for my ever expanding collection. :)

I'm so addicted to the Baofeng radios, I already have the original UV-5R, UV-5RA, UV5RE Plus, and just received a couple of the UV-5R 8W (Tonfa) UV-985's. OK, so it says TONFA on the box, But I'm sure it is made by Baofeng. I've only had it a couple of days, but depending on the frequency, it does transmit between 6-10 watts. Has anyone else tried these units?

36291. Re: [baofeng_uv5r] Baofeng UV-5R strange reception after monitoring for a few minutes

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-04 03:19:50 UTC
From: Colorado Rob
Topic: 36156 Message: 36291

I am very well aware of the limitations and possibilities with email communication. I have developed multiple email delivery engines for a major internet player for a living. I can quote you IETF RFCs and W3C standards all day if you'd like. I know exactly how character encodings, characters sets and fonts relate to one another. And I know most of the ways in which buggy clients screw up the formatting of emails as well as their rendering.

I cannot fix Stan's email client (or Barry's for that matter, but the less he sees the better), so I was gently pointing out to Stan that his new font choice does not always display as intended by describing what I saw. Most folks here really do not care about the technical details of how email is formatted and rendered. All they care about is getting their point across with the least fuss.

In Stan's case Microsoft "Smart Quotes" screwed up his email format and, not knowing better, he thought changing his font would help. Maybe, but using "the wrong font" wasn't the problem to start with. Nor should he necessarily know that. His problem was not due to a font issue -- it was due to a text formatting and character set issue.

But beyond that, once the font change was made, a "good" email client would provide an alternate font suggestion such as "Serif" to help the recipient render the text as close to the author's intention as possible. See the CSS font-family property documentation<http://www.w3schools.com/cssref/pr_font_font-family.asp>for how that's done. Instead, its "Georgia or nothing" with the way the HTML in the email is formatted. He cannot fix that other than by using a different email client.
I can talk about normative email behavior as well. Regarding use of bold -- when used sparingly it is seen as strong emphasis (stronger than italics). Beyond that, it has the same effect as all caps. It is not just me. <https://www.google.com/search?q=bold+text+as+yelling>

I know it is very difficult for you, but please try not to be such as ass on this list. Don't pretend to be an expert on a subject when you clearly are not.

Richard,

Do you realize that VIP does not remember or detect the correct COM port?
Unless you are lucky enough to be using COM1, every time you launch VIP you
have to open the Communication Port Setup menu and reselect the COM port
that was assigned to the programming cable.

Yes I do
The fact that I was able to select "other" and write the message settings back to the device showed me that I had the correct com settings. I just could not write the .dat file back to the device. I have since found the information I wanted in a .img file so I have been able to use chirp to write the settings I required.

Chris,

Sounds to me you are using the CHIRP 0.3.1 stable. v0.3.1 was released in
April of this year. Support for the UV-82 wasn't added until July so you
have to use a daily build for UV-82 support.

Interesting. I have an older UV-5R, so I have to use a different VIP
version than you. I don't know if this correlates to the newer radios with
BFB291 and newer firmware or not, but I find that the Baofeng programming
software seems to be more reliable when the radio has the [A] display
selected. It doesn't seem to make any difference when using CHIRP.

As far as I know, CHIRP can do everything that VIP can do (and then some).

There are no private frequencies in amateur radio.
Amateur radio frequencies are shared by all licensed users.

There are, however, private repeaters that are not open to everyone that happens to find the correct PL tone and offset. Try chatting on a private Cactus repeater system and see how long you last before it suddenly stops working, or you are asked (politely) to change to another frequency.

The post was talking about repeaters, not frequencies. The following is
from the ARRL Auxiliary Station FAQ.

Who may use a repeater or remote base?
The licensee of any amateur station has the right to limit the use of his
or her station to only certain other licensees! When it comes to repeaters,
the FCC even says so in Part 97. This rule states limiting the use of a
repeater to only certain users is permissible [97.205(e)]. "Closed"
repeaters may use CTCSS or other techniques to limit access to designated
users.

The FCC has pointed numerous times that repeater owners and trustees CAN say who can and cannot use their repeaters. Only a few are totally private, but individuals can be barred from and fined for using certain repeaters.

Repeaters use frequencies and no user may claim any frequencies for themselves.
You can shut your repeater down but you may not prevent legitimate use.

And the FCC will tell you "Sorry". They have the right to limit, as it is their radio equipment. Just like you can say who can use your radio room and who can't. Check the FCC fines section. A large portion is directed at people who did not stop using repeaters when told to.

Is it possible for you to make a video showing your problem (before and after) and upload it to the files section?

If you have 2 radios doing this I tend to think either we don't understand your problem exactly or you are doing something wrong.

Or can you download from the radio both before and after and post those 2 files so somebody can duplicate your problem?

We also have an expert on here that can examine those files to see what's going on.

Basically the problem is, I can program lets say 20 channels in the radio. I have had it happen 3 times to where when you turn the radio on the channel names are there, when trying to transmit on one of the channels it don't work. I read the radio to find the RX, TX frequencies are not there anymore as well as the PL. I have found the channels that are missing to either Channel one or two or both. I reprogram the radio and they are there and will transmit and then sooner or later it happens again. I know on the UV-5R there is not a way to delete a channel out of the scan list without deleting it altogether and thought maybe the channels are being accidentally deleted, so I locked the number pad and it still happened.

I've had this happen one time. PL was automatically added to a police channel I monitor. I couldn't reset it using the keypad but fixed it an Chirp and it hasn't happened again.

Find your local NOAA channel and try to listen to that.

Not sure exactly what you mean by “gibberish and broken noise”. Do you mean you can hear what sounds like people talking and the noise background fluctuates a lot?

Are you sure? My 1-1/2 year old UV-5R (BFB231) will let me key in any frequency into the VFO within the band limits that I have set using CHIRP. If I don't key in a frequency that is within the selected band, I will get "cancel". As far as I know, the newer radios auto-select the correct band based on the frequency keyed in.

>
> Well this one tunes to a range of 128-199 mhz and 390-525 mhz before

Like I said, mine as always done this.

>

Mine does too. I pick up the city's bus system on 800 something MHz. I've not bothered to find out what frequency the bus service is really on, but I'm sure it isn't the displayed frequency. I'm scanning that range right now to see if I can find it again.

Somebody once posted awhile back what some of the out-of-band displayed frequencies translate to. I didn't bother to archive it since I know the radio won't function much out of the manufacturers specified frequency range.

>
> While I know the freq rejection filter range would attenuate these

So then how did you determine that it can transmit and receive in these ranges. The thing that I am fairly sure about is that a lit red TX LED does not guarantee that the radio is generating RF.

>
> Anyone else have this ability to tune this wide in Freq mode?
>
>
Like I said before, if I set the corresponding band limits with CHIRP, I can key in any frequency from 100.00000 MHZ to 999.99750. But the useable range (at least for my radio) appears to be the following:

VHF range 127.8 - 176.0 MHz
UHF range 383.5 - 524.3 MHz

My UV-5R won't do that, and I'd like it to There are some
channels in the 396-399 MHz range that are interesting.
What firmware does CHIRP say your radio has?
In my case no matter what you set the low end to in
the Other Settings menu the low end is 400.0 MHz.

CHIRP is programmed to only let you enter frequencies between 136-174 MHz and 400-520 MHz. When you set the band limits outside of these ranges, you have to enter the expanded frequencies from the keypad of the radio. CHIRP will let you download and upload the out-of-range frequencies, you just can't edit them with CHIRP.

I recently completed a TNC-X KISS modem, but am having difficulty with reception using the UV-5RA. If I hold the HT in my hand, reception is flawless. If I set the radio down, it no longer decodes packets. The radio is still receiving the signal, because the modem yellow light still comes on, but something is screwy.

I've tried shielded cable, maximizing the distance between the HT and the computer and modem, etc. Its a home made cable, so I don't know if there is something (capacitor ?) that is built into the stock speaker/microphone cables that I should add to my homemade cable?

Any other ideas?

They've been recently discussing using a ferrite cores on the UV-B5 group.
They don't sound like they are very expensive and someone mentioned that
you might be able to pick one up at Radio Shack. This link has a picture of
a ferrite core on the cable between the UV-B5 and a mobilinkd TNC.

When you have the radio in your hand, your body makes the other half of the dipole antenna. When you put the radio down, half of your antenna disappears. Please don't ask which antenna is better to use, as a check of the archives will show you several past conversations and comparison charts already done for that question.

Hi there,

I am wondering if there is some website that has ready-made files for CHIRP for different areas. For instance, I live in West LA/Beverly Hills. Surely someone has already programmed the frequencies & repeaters in the area?

Are these collected anywhere?

Thanks! Any tips would be most appreciated.

Thanks. I did try the Ferrite Cores (both sizes that were available at RadioShack. No change.

I should also mention that Transmitting is no problem.

I think the next step will be to try a small capacitor (10 uf?) between the RX+ and - to try and filter out any high frequency noise that might be picked up. First I might try the Tigertail.

If you are programming the channels of your UV-5R with software, the STEP size is irrelevant. STEP size only matters when you are keying frequencies into the VFO using the keypad. STEP is like a mask that only lets the radio tune in frequencies based on a specified frequency spacing. If you can key the desired frequency into the VFO (a fine adjust may also be needed with the arrow keys), then the STEP size is fine. But when even after using the arrow keys, the frequency of the VFO skips over your desired frequency, then the STEP size would need to be adjusted.

The noise that you describe has been around in various UV-5R radios since they were introduced back in early 2012. The problem was described in a document back in April of 2012. This document, UV5R_tech_discussion_fixes.pdf, is still available in the group files area. I've also placed a copy here:

http://kc9hi.dyndns.org/uv5r/programming/UV-5R_tech_discussion_fixes.pdf

When my UV-5R goes to oscillating like this, I can usually get it to settle down by cupping my hand around the middle of the antenna until the oscillations stop.

I’m not sure it’s not exactly randomly breaking squelch. For instance I listen and transmit perfectly on UHF. On any given day, if I run the scan I get at least 10 services and family chats and also radio taxis (disconcertingly close to gmrs freq and load and clear). But in VHF it’s a different story. I hardly ever get clear chats – mostly chatter which I’d describe as shr-rsh-rsh-shrr. I know there’s transmission because it breaks squelch (I’m using level 7). I also get a few VHF radios – some probably illegal – and yesterday got a short chat. Since I was travelling and I just got the radio I haven’t been able to use it “for real” and but rather have been learning to manually program it at home and scanning the neighborhood at night, it might be nothing. Also, I live in a giant building complex with a granite mountain next to it (and TV repeaters on top) and lots of trees, uphills and downhills so it is possible the the reception/propagation of VHF waves is seriously impaired, but the short distance UHF does a lot better with all that concrete/rocky environment.
I checked the local hams page last night for other hams in the neighborhood but got none within less than 3 or 4km from me. Too far to get good reception for the terrain I’m in. But I’d expect to be able to listen to a lot…..
I’ll take the radio out of the playground this weekend ;)

"Stan Labinsky Jr." <k2stn@...<mailto:k2stn@...>> wrote:

If you are programming the channels of your UV-5R with software, the STEP size is irrelevant. STEP size only matters when you are keying frequencies into the VFO using the keypad. STEP is like a mask that only lets the radio tune in frequencies based on a specified frequency spacing. If you can key the desired frequency into the VFO (a fine adjust may also be needed with the arrow keys), then the STEP size is fine. But when even after using the arrow keys, the frequency of the VFO skips over your desired frequency, then the STEP size would need to be adjusted.
The noise that you describe has been around in various UV-5R radios since they were introduced back in early 2012. The problem was described in a document back in April of 2012. This document, UV5R_tech_discussion_fixes.pdf, is still available in the group files area. I've also placed a copy here:

http://kc9hi.dyndns.org/uv5r/programming/UV-5R_tech_discussion_fixes.pdf

When my UV-5R goes to oscillating like this, I can usually get it to settle down by cupping my hand around the middle of the antenna until the oscillations stop.

I had this same problem with the UV-5R Plus. Never resolved the issue. To u take the Q-Tip and Alcohol and clean the contacts? I thought it was possibly malfunctioning software. I've tried the FM Mode and it never worked. I got a replacement, the new one was able to hear radio stations and the broken one never once heard any station. What are the steps to clearing or fixing the mic jack?

I like the fact that CHIRP has a query you can use to find repeaters with all the info you need....copy and paste the info into your spreadsheet and upload to your radio.

Click RADIO at the top, and the QUERY DATA SOURCE. 3 options come up...Radio Reference-if you have an account with them, Repeaterbook, and RFinder.

I had my new radio programmed in 10 minutes once I was able to get my laptop to recognize the cable.

Good luck!
Phil

Hi there,

I am wondering if there is some website that has ready-made files for CHIRP for different areas. For instance, I live in West LA/Beverly Hills. Surely someone has already programmed the frequencies & repeaters in the area?

Are these collected anywhere?

Thanks! Any tips would be most appreciated.

I'm not sure it's not exactly randomly breaking squelch. For instance I listen and transmit perfectly on UHF. On any given day, if I run the scan I get at least 10 services and family chats and also radio taxis (disconcertingly close to gmrs freq and load and clear). But in VHF it's a different story. I hardly ever get clear chats – mostly chatter which I'd describe as shr-rsh-rsh-shrr. I know there's transmission because it breaks squelch (I'm using level 7). I also get a few VHF radios – some probably illegal – and yesterday got a short chat. Since I was travelling and I just got the radio I haven't been able to use it "for real" and but rather have been learning to manually program it at home and scanning the neighborhood at night, it might be nothing. Also, I live in a giant building complex with a granite mountain next to it (and TV repeaters on top) and lots of trees, uphills and

downhills so it is possible the the reception/propagation of VHF waves is seriously impaired, but the short distance UHF does a lot better with all that concrete/rocky environment.

I checked the local hams page last night for other hams in the neighborhood but got none within less than 3 or 4km from me. Too far to get good reception for the terrain I’m in. But I’d expect to be able to listen to a lot…..

I’ll take the radio out of the playground this weekend ;)

If you’re saying it’s randomly breaking squelch and this is a new radio I’d send it back and get a replacement.

I had one doing a similar behavior and it was bad.

Subject: [baofeng_uv5r] Broken reception/noise

Hi peeps.
Most channels I get to listen on the VHF sound like gibberish and broken noise. What are the possible causes? May it be that my antenna is not picking up enough, shadow area, or what other causes?
I know this is not strictly related to Bao's, so sorry. I'd ask somewhere else if i knew

about other groups
Thanks

Depends on the specific models of such things.

Some computers/monitors/speakers are horrendously noisy.

Nothing weird about it.

A buss speed of 133 MHz means that there is a signal
source in the computer at 133 MHz - and that may be
divided down from x2 or x3 or x4 or even x8.

A CPU speed of 2Ghz means that there is a oscillator
at 2 GHz - and that is frequently divided down for other
purposes.

My computer emits a nice strong signal at 500 MHz
that breaks my squelch 25 feet away...

Some TVs and computer monitors are noisier than
desktop computers, but the wall wart that came with
my external hard drive case was super noisy.
Fortunately I had one of the same plug, same voltage,
similar current, and was able to use it and toss the
one that came with the hard drive case.

No ideas. I've got one that works just like that. Have tried external speaker-mic, external speaker, opening it up and checking speaker/earphone connector, etc. No luck. Suspect whatever part of whatever chip does the audio amplifiying is dead. Worked when I got it, but died about a month later (with very little use). I guess you get what you pay for, it's the first handheld I've had that failed on me (and I've had hundreds).

> How do you program your UV-5RE Plus? Do you have a receive CTCSS tone or receive DCS code programmed and the station that is transmitting is not transmitting the matching tone/code? If that is the case the radio will show a signal being received but the squelch will not open. You can test this by pressing and holding the [MONI] button in to override the squelch and any CTCSS tone or DCS code that may be programmed. You can also look at the left status display and if you see a CT or DCS to the left of the top line while receiving, then you have a receive CTCSS tone (CT) or receive DCS code (DCS) programmed.

OK, that explanation makes sense.

You are NOT listening to any signal. You are hearing the radio being overwhelmed with a strong signal on another frequency.

The most common cause of this is usually a paging system transmitter within a few miles of your location, but any strong signal can cause the problem.

By the way, let me also mention that changing to a “better” antenna would only make the problem worse.

Thanks Jim. You are the man. The radio wouldn't save my changes to CTSS so I had to reset the radio. It's working fine now.

You can not change most settings of a programmed (only the TX freq, the TX
CTCSS tone or TX DCS code can be updated). You have to erase the channel
with menu 28 and then program it back the way you need it.

See the "Reference for UV-5R Menus"
http://kc9hi.dyndns.org/uv5r/programming/UV-5R%20Menus.pdf

Note: Don't program an R-CTCS tone or R-DCS code unless you understand why
you think you need it. R-CTCS and R-DCS set to OFF will always work.

Mike Morris <wa6ilq1@...> wrote:

Nothing weird about it.

A buss speed of 133 MHz means that there is a signal
source in the computer at 133 MHz - and that may be
divided down from x2 or x3 or x4 or even x8.

A CPU speed of 2Ghz means that there is a oscillator
at 2 GHz - and that is frequently divided down for other
purposes.

My computer emits a nice strong signal at 500 MHz
that breaks my squelch 25 feet away...

Some TVs and computer monitors are noisier than
desktop computers, but the wall wart that came with
my external hard drive case was super noisy.
Fortunately I had one of the same plug, same voltage,
similar current, and was able to use it and toss the
one that came with the hard drive case.

Xaun is correct. I use my Baofeng as a mobile in my car. Depending on where I am and time of day I get the same thing. The radio is not particlarly selective. Garage door openers, wi-fi, security systems can produce signals that will overwhelm it.

Hi all,
I have tried to save new frequencies to my UV-5R but no luck this is hwat I mean:-

In frequencie mode I input 145.800 then Menu 25 SFT-D to minus then save, then Menu 26 OFFSET to 00.600 then save
Back to frequencie mode, ok I thought so far so good, but when trying to save I use Menu 27 Save CH002 in this case then I hear memory channel receiving memory then MENU again memery channel, transmitting memory.
I then come out of MENU back to EXIT button back to frequencie mode.
I then goto channel mode to see my new frequencie and then press the TX button to see it stays on 145.800 and not 145.200 when the TX button is pressedas it should do.

What the heck am I doing wrong here?

I am totaly stuck any help will be great,

Many thanks.

Mike.

You missed a step. After you write 145.800 (the RX frequency) to CH002 and return back to frequency mode, you have to then input 145.200 (the TX frequency) and then write it to CH002.

If you key in 145.200 in manually, then you don't have to bother setting menu 25 or menu 26. They are only used in frequency mode and are not saved to the memory channel.

But if you do set menu 25 and menu 26 (some like to do this to test out the settings for saving them to a channel), then you can tap the [*SCAN] key to put the radio into "reverse" mode. The letter "R" will appear in the upper status display to indicate that the radio is on "reverse" mode and the RX frequency in the display will be swapped with the TX frequency (saves you from having to key it in).

Hi, I have a UV5R+ I'm having a transmit problem I need help with.
I have the rubber duck and an RH771.

Receiving works perfectly.
But when I try and transmit on VHF to my friends who have Motorola in car units they are unable to hear me. Their radios detect my transmission, but no voice is heard - it's totally silent. This is the same with both external mic and the built in mic.

The only way I can get them to hear me is immediatly after they key for the first time. Right after they transmit for the fist time, I can hear them perfectly and I can also transmit and receive fine after than.

We also noticed that after a length of time, my uvr5 reverted back to not being heard again, and I was only heard again after they keyed one time.....like something had woken up.

I've tried a full reset & running on low power and wide/narrow, but it hasn't helped, I can only be heard after the first time they transmit.

Any ideas would be gratefully received.

Thanks, Jay

Jay,

Simple. Your friends radios are setup to require a specific CTCSS tone (or DCS code) to be transmitted to open their squelch. You are not transmitting that tone/code. They either have to turn off their requirement for a tone to open their squelch or you have to program your radio to transmit the tone that they require.

What is CTCSS/DCS?

If they are like an FRS/GMRS radio, they may be called privacy codes instead of CTCSS, but they are the same thing. If they don't know that they've programmed then, then they probably do not know what frequency they are. If they can talk to each other, then they must be transmitting the CTCSS tone, too. You can scan for the tone with the UV-5R.

These are not off the shelf FRS/GMRS, they're re-purposed taxi radios.

So am I correct in thinking once the squelch is opened up, it's no longer required for subsequent transmissions after that...and it stays open for a set time after transmission had ended?

I'd say you are right. Apparently once the correct tone is recognized, the
squelch is latched open until the signal goes away. I guess that would be
TCSS instead of CTCSS. ;-)

Hi Brad,

The issue is that your body changes the RF field around the HT. It is possible that if you listen to the audio from the radio with it unplugged from the TNC you can hear a difference. Jardy's answer is likely the right one.

You might try putting the radio down on a cookie sheet or a metal filing cabinet. That will make a ground plane under the radio. Or try a different antenna -- a mobile 1/4 wave (if you have a ground plane for it) or 5/8 wave antenna, connected via coax might give you better reception.

Another possibility is that by holding the radio in your hand, you are shielding the radio from some local interference. That's not uncommon around a computer. The only answer I have for that one is to track down and eliminate the source.

Hi Tom,

How much hardware and software hacking do you want to do? The
Arduino-based TNC described at BertOS is an easy way to get started. You
can build one with an Arduino, a breadboard, and a few components.

http://www.bertos.org/media/bertos/website/example/schema/BeRTOS_APRS.png

You can find pre-compiled software for it here:

https://sites.google.com/site/ki4mcw/Home/arduino-tnc

You can get all the materials from TNC-X.COM. Software, directions, etc.

I've tried shielded cable, maximizing the distance between the HT and the computer and modem, etc. Its a home made cable, so I don't know if there is something (capacitor ?) that is built into the stock speaker/microphone cables that I should add to my homemade cable?

Any other ideas?

An easy way to do it is to enter 145.800 in the A display, now save it to the clear memory channel then exit. Enter 145.200 on the A display and save that to the same memory channel and exit. That's it. No offset needed. It saves the receive first then the transmit. They could be almost anything.

I have been building files like this for a couple years in various cities I
have lived in. I have a baofeng that I need to program but for some readon
am unable to communicate with it so far.

Anyways, I have a file for the Seattle area, but I suspect what would be
nice to create is a drag and drop type system where we can select
frequencies from a great list and put into the programming platform.
copy and paste sucks.

Yes, I wish it were possible to program NO XMIT on a per-channel basis. For similar such frequencies here I set "Power" to "Low" in case of accidental PTT activation while listening, such as releasing the belt clip and grasping the radio wrongly.

Gary,

Wish no more. I've been programming "NO XMIT on a per-channel basis" since I received my UV-5R in early April of 2012. You can do it with the Baofeng CPS and VIP software and with the CHIRP software. You just can't do it from the keypad.

That is the answer I considered sending, but instead I went through the entire site so I could point him to a more specific location to find the answer. Despite this same question being asked at least once a month, it is apparently not considered a Frequently Asked Question.

The answer IS in the FAQ section but it is buried as part of the answer to FAQ #51 where you have to read basically all the answers because the question doesn't clearly describe the issue.

This is the kind of question that gets asked by people who don't have the experience or knowledge that would be needed to find the answer where it is buried.

Just about everything. (Sorry, but that IS the answer to your question)

Go to the Miklor website (the link is at the bottom of this and every other message in the group).

You will find several sets of manual programming instructions.

Read each of the manual programming instructions.

Those instructions will sound different to a new user, but they are actually all doing the same thing in almost exactly the same way. Don't worry about what you think are differences, but just pick the set of instructions that seems easiest for you to understand.

PRINT OUT THE DIRECTIONS YOU CHOOSE

Follow those directions step by step. Do not read ahead. Do not think about why. Just do exactly what each step says.

Once you have successfully programmed a few frequencies it will become easy.

You want to be careful uploading CHIRP .img files from an unknown source into your radio.

This year there have been quite a few instances of group members with UV-5R behaved in strange ways and it was eventually determined that these radios had one or more bytes in thie memory with an unusual value (corruption?). Loading an image saved from one of these radios (before they were repaired) would have transferred the erratic behavior to the radio that the image was uploaded to.

The save .img file from UV-B5/UV-B6 contains the "test mode" settings. Someone could share an image from this radio with all of the power level settings increased to the maximum value (accidentally or maliciously). Uploading this image to your B5/B6 would the set your "test mode" power level settings to maximum. Transmitting, even for a short period of time, at thesesettings have been known to damage the UHF finals in at least 1 radio that I am aware of.

The safest way to trade channels would be to load the shared .img file with your .img file and transfer the desired channels between tabs using cut and paste.

I should add that if you need a transmitted tone, you should put that in the VFO also before you save to the memory channel. Once in there, you have to clear that channel and start over if you want to change it. Glad I could help.

When I got the radio a few weeks ago, uploading a list of repeaters was a breeze using the cable and Chirp.

Today, no joy. I have reviewed everything from www.miklor.com, the driver, this web site, and Chirp's web site. Everything seems correct.

The one thing that stands out is from the Chirp web site where it mentions the problem way be with cable plugs if the TX is keyed when you plug it the cable. The red LED on my radio comes on when I plug the cable in. Seems strange that the cable could go bad sitting in a drawer for several weeks.

The outlet itself on the radio seems to be fine, since I use it with the speaker/mic and the headset with no problem.

Is there some setting I have forgotten on the radio before cloning? I don't remember any such thing.

Or should I just consider the cable to have gone bad?

The one thing that stands out is from the Chirp web site where it mentions the problem way be with cable plugs if the TX is keyed when you plug it the cable. The red LED on my radio comes on when I plug the cable in. Seems strange that the cable could go bad sitting in a drawer for several weeks.

The outlet itself on the radio seems to be fine, since I use it with the speaker/mic and the headset with no problem.

Is there some setting I have forgotten on the radio before cloning? I don't remember any such thing.

Or should I just consider the cable to have gone bad?

Hi

Does any one has an idea or knowledge if Chirp can be used to program the
Baofeng BF-666S ? (a UHF only 16 channel radio)

thank you

The answer is yes and no.

Yes, because support has recently been added for the Baofeng BF-888S, which
as far as I know should also work for the BF-666S, BF-777S and a few others.

No, because even though the upload successfully goes through the motions,
none of the settings are written to the radio. A bug has been submitted for
this issue but I don't think it has been addressed yet.

So try it out. You should be able to download your settings from the radio.
Then make a change and upload it to your radio. If the setting doesn't
change, the go the the CHIRP website and add your comment to confirm the
existing submitted bug report (don't create a new one).

Another thing that you can do is give baoclone a try.

Or simply use Baofeng's software on their website, which works like a champ.

All right...I purchased 3 of these radios this week for my sons and I since we received our tech licenses this past weekend.

I can program without any problem with CHIRP. I can open the repeaters, no problem. I can hear a roger beep on my scanner when testing.

I cannot hear any voice though. I tested these radios on a different frequency in the 136 range and they do transmit to one another, voice is clear as a bell.

But not through a repeater. I used CHIRP for entering all the info needed for each of the repeaters, copy and paste or have CHIRP load it.

Not sure what I'm doing wrong here....

Thanks in advance!
Phil

xmit on 136?

If you're in the same room with the other radio, and trying to hear yourself through a repeater, it isn't going to work. The transmitter will make the receiver deaf.

Mike,

I would suggest that with CHIRP closed, you go to Start->Run (or the Start search box) and type "%APPDATA%\CHIRP" (without the quotes). Open the CHIRP folder that appears and either delete or rename the "chirp.config" file. Launch CHIRP, download using COM5 and finally close CHIRP. This will create a new "chirp.config" file. See if CHIRP remembers the COM port after that.

I am guessing COM4 and COM5 are the front USB? If it is the front USB, I advise trying the rear ones. The go in to Control Panel and opening System. Under the communication/Ports, ensure there aren't any small icon on it that is red or yellow. If so, update the drivers. Use the one on your computer. When the list appears, do not, and I mean DO NOT use the most recent drivers. Look for the one or two below the recent one. Hopefully, you won't have to do this every time. If you need further help, let me know and I'll try to get screenshots for u. Andre KD2EQZ@gmail.com

Andre,

Did all of what you suggest...except my computer has only side USB plugs.

The best driver is the 3.2.0.0, which I have had on my computer since I got the UV-5R.

I will never know exactly what happened, but eventually after many repetitions of selecting the driver and COM port, it finally connected yesterday.

Now I am having similar problems with HRD and my Yaesu FT-897 (another Yahoo user group) and a new serial-USB cable I just got. :)

I thought the 3.2.0.0 would also work with that, but no joy.

☐

Xaun is correct. I use my Baofeng as a mobile in my car. Depending on where I am and time of day I get the same thing. The radio is not particlarly selective. Garage door openers, wi-fi, security systems can produce signals that will overwhelm it.

OK, that explanation makes sense.

You are NOT listening to any signal. You are hearing the radio being overwhelmed with a strong signal on another frequency.

The most common cause of this is usually a paging system transmitter within a few miles of your location, but any strong signal can cause the problem.

By the way, let me also mention that changing to a “better” antenna would only make the problem worse.

Hi peeps.
Most channels I get to listen on the VHF sound like gibberish and broken noise. What are the possible causes? May it be that my antenna is not picking up enough, shadow area, or what other causes?
I know this is not strictly related to Bao's, so sorry. I'd ask somewhere else if i knew about other groups
Thanks

ed,
sounds to me that you plug and unplug your usb each time you want to program
a radio. may i suggest that you install and 8 or 10 port hub, plug your usb into it
and leave it there. i believe every time you plug a usb in (xp) it will just look for
a port and use that one, then the program won't see the right port.

i have 3 cables pluged in, for different radios, and don't remove them. just have to
be sure i use the right cable for the radio i want to program.

i think a lot of people with cable issues are plugging the usb into their computer each
time and that is what is causing their problems.

zippy,

1. It IS possible to program any individual channel to not transmit, using any of the readily available software programs.
2. The radio can easily "monitor" any frequencies within range without being set up to illegally transmit on those frequencies.

From: Gary Dunn

On 11/08/2013 12:18 PM, R Pryor MAEd CETsr wrote:

Notice memory 126 and 127 are LA county Sherriff and Fire Department monitor those only –NO XMT- or you can delete them. I put those in if there is an earthquake in the area the radio can monitor these and possibly save lives.

Yes, I wish it were possible to program NO XMIT on a per-channel basis. For similar such frequencies here I set "Power" to "Low" in case of accidental PTT activation while listening, such as releasing the belt clip and grasping the radio wrongly.

Well, one thing you are doing wrong is risking your newly acquired license by illegally transmitting on an unauthorized frequency – which seems especially silly considering that you have literally thousands of perfectly legal frequencies available.

The next thing you are doing wrong is not reading the information on the miklor website. Since reading all the information is obviously too much trouble, try reading just the FAQ. If that is too much trouble, at least read FAQ #22 “I can't hear my signal through the repeater, but I hear the repeater tail” which describes your specific problem.

Xaun,

For one thing, it was a typo....excuse me. I did it on the 146 range, are you happy?

As far as the FAQ's, I have gone through them already.

Third, don't come off as a complete dick. Your douchebaggery is boring.

Have a nice day.

Phil

Well, one thing you are doing wrong is risking your newly acquired license by illegally transmitting on an unauthorized frequency – which seems especially silly considering that you have literally thousands of perfectly legal frequencies available.

The next thing you are doing wrong is not reading the information on the miklor website. Since reading all the information is obviously too much trouble, try reading just the FAQ. If that is too much trouble, at least read FAQ #22 "I can't hear my signal through the repeater, but I hear the repeater tail" which describes your specific problem.

Subject: [baofeng_uv5r] Can open repeater, but no voice coming though...

All right...I purchased 3 of these radios this week for my sons and I since we received our tech licenses this past weekend.

I can program without any problem with CHIRP. I can open the repeaters, no problem. I can hear a roger beep on my scanner when testing.

I cannot hear any voice though. I tested these radios on a different frequency in the 136 range and they do transmit to one another, voice is clear as a bell.

But not through a repeater. I used CHIRP for entering all the info needed for each of the repeaters, copy and paste or have CHIRP load it.

Not sure what I'm doing wrong here....

Thanks in advance!
Phil

36454. Screen locked up/ frozen

Excellent point, one which I somehow assumed the OP was aware of. The symptoms certainly match that solution.

After reading your problem and seeing the answers I started to form my own opinion. Then after seeing your answer to Xaun I changed it completely.
>All right...I purchased 3 of these radios this week for my sons and I since we received our tech licenses this past weekend.
Do you think you could sign with your call? Common courtesy.
>I can program without any problem with CHIRP. I can open the repeaters, no problem. I can hear a roger beep on my scanner when testing.
You are kerchunking, frowned upon by the repeater operators. The roger beep had a place in CB so the other operator knew you stopped, but not on a repeater. Unless you meant something else like the repeater unkeying.

>I cannot hear any voice though. I tested these radios on a different frequency in the 136 range and they do transmit to one another, voice is clear as a bell.
It might have been a type, but if your doctor put it on your medical chart, it could kill you. Proofreed!
But not through a repeater. I used CHIRP for entering all the info needed for each of the repeaters, copy and paste or have CHIRP load it.

Not sure what I'm doing wrong here....
Your right, but remember a lot of hams were CB'rs, myself included, and we want to help. You will find there is a difference. The old CB'rs helped each other all the time and so do the hams.
The current CB'rs don't git a rodents rectal orifice about the other guy and will step on them.
My 14 cents

Thanks Ed, I appreciate it.

I was a bit irritated when I sent that, so I apologize.

Apparently I am getting through, I was heard over the scanner earlier...I had a friend who called me...

I'll get rid of the roger beep....as I stated previously, I'm new to this and I know there's do's and don'ts....I just don't know what is what as of yet. It's just like having to learn how to ride a bike all over again.

Thanks!

Who says 'Kerchunking' is frowned upon ?
It is a very quick and simple action to confirm that you can open the repeater.
Asking a question about signal strength etc. is taking more repeater time then a simple mike click !

Kerchunking is transmitting without identifying at the end of your transmission. Illegal per the FCC in the States, and I know several repeater owners that will ask you to stop using their repeaters if you continue. Legal per FCC in the States.

Thanks for all of the advice and the replies guys. I'm picking up all kinds of good information.

I made my first contacts tonight. My kids and I were coming home from Milwaukee and I contacted 2 great guys on one of the repeaters there.

Everything is working just fine. Apparently things are just too quiet in my neck of the woods.

Thanks again!

Subject: Re: [baofeng_uv5r] Can open repeater, but no voice coming though...

When you transmit to a repeater do you see the CT icon appear and does the xmt freq show as different

example

146.600 is my radio receive frequency display

when I press the mic the freq during transmit changes to 146.000 and the CT icon shows.

This shows a – offset 600khz with a CT code (almost all repeaters use some code)

This is a typical properly programmed repeater memory channel for VHF

ED,

I'M USING A 10 PORT, USB 2.O HUB. THE ONLY IDENTIFICATION NAME ON IT IS 'PLUGABLE'.
I BELIEVE IT HAS 2 HI POWER PORTS ON THE REAR, 2 PORTS THAT SWING UP VERTICALLY
AND 6 PORTS ON THE FRONT.

THE ONE BEFORE IT WAS A D-LINK, DUB-7 THAT I USED FOR SEVERAL YEARS.
I HAVE ALSO USED 4 PORT FOR THE NETBOOK.

I DID HAVE A D-LINK DUB-7 THAT A PORT WENT BAD, OTHER THAN THAT I NEVER HAD
ANY PROBLEMS WITH THE HUBS. THEY REALLY ARE NOT THAT EXPENSIVE.

GOOD LUCK,
ZIPPY

Zippy,

Not a bad suggestion.

Can you recommend a model?

I may not have enough room any more on the table, unless it is very small.

☐

ed,
sounds to me that you plug and unplug your usb each time you want to program
a radio. may i suggest that you install and 8 or 10 port hub, plug your usb into it
and leave it there. i believe every time you plug a usb in (xp) it will just look for
a port and use that one, then the program won't see the right port.

i have 3 cables pluged in, for different radios, and don't remove them. just have to
be sure i use the right cable for the radio i want to program.

i think a lot of people with cable issues are plugging the usb into their computer each
time and that is what is causing their problems.

zippy,

Andre,

Did all of what you suggest...except my computer has only side USB plugs.

The best driver is the 3.2.0.0, which I have had on my computer since I got the UV-5R.

I will never know exactly what happened, but eventually after many repetitions of selecting the driver and COM port, it finally connected yesterday.

Now I am having similar problems with HRD and my Yaesu FT-897 (another Yahoo user group) and a new serial-USB cable I just got. :)

I thought the 3.2.0.0 would also work with that, but no joy.

RAY,

FOR YOUR EDIFICATION. JUST BECAUSE YOU CAN OPEN THE REPEATER DOES NOT MEAN YOU CAN COMMUNICATE THROUGH IT. THIS IS ESPECIALLY TRUE IF USING A HT, OR ON THE FRINGE OF THE REPEATER. YOUR AUDIO 'PUNCH', OR LACK THEREOF MAY NOT LET YOU BE HEARD.

ZIPPY,
WS3PC / N3PC

Who says 'Kerchunking' is frowned upon ?
It is a very quick and simple action to confirm that you can open the repeater.
Asking a question about signal strength etc. is taking more repeater time then a simple mike click !

After reading your problem and seeing the answers I started to form my own opinion. Then after seeing your answer to Xaun I changed it completely.

>All right...I purchased 3 of these radios this week for my sons and I since we received our tech licenses this past weekend.

Do you think you could sign with your call? Common courtesy.

>I can program without any problem with CHIRP. I can open the repeaters, no problem. I can hear a roger beep on my scanner when testing.

You are kerchunking, frowned upon by the repeater operators. The roger beep had a place in CB so the other operator knew you stopped, but not on a repeater. Unless you meant something else like the repeater unkeying.

>I cannot hear any voice though. I tested these radios on a different frequency in the 136 range and they do transmit to one another, voice is clear as a bell.

It might have been a type, but if your doctor put it on your medical chart, it could kill you. Proofreed!

But not through a repeater. I used CHIRP for entering all the info needed for each of the repeaters, copy and paste or have CHIRP load it.

Not sure what I'm doing wrong here....

Your right, but remember a lot of hams were CB'rs, myself included, and we want to help. You will find there is a difference. The old CB'rs helped each other all the time and so do the hams.

The current CB'rs don't git a rodents rectal orifice about the other guy and will step on them.

My 14 cents

Well, one thing you are doing wrong is risking your newly acquired license by illegally transmitting on an unauthorized frequency – which seems especially silly considering that you have literally thousands of perfectly legal frequencies available.

The next thing you are doing wrong is not reading the information on the miklor website. Since reading all the information is obviously too much trouble, try reading just the FAQ. If that is too much trouble, at least read FAQ #22 "I can't hear my signal through the repeater, but I hear the repeater tail" which describes your specific problem.

Some how you've gotten TX inhibited on your UV-5R. This was a common happening back when the BFB291 and BFB293 firmwares were released. The radio would be turned on with various key combinations and when the right (or wrong) combination was tried, the band limits were goofed up. As far as I know, nobody has figured out what that sequence was.

Unfortunately, the only 'fix' that I know of for the problem requires a programming cable and software. Sorry.

I have updated the Chirp LiveCD with the 31Oct2013 daily build. It is available at: http://sourceforge.net/projects/chirplivecd/

The only change it the updated daily so if you are running it as a LiveUSB and have updated, you already have the most current version.

Bob

36476. Modify 200 Mhz?

Topic: 36476 Message: 36476

I have a Baofeng UV5R with 2 meters and a 200 MHz band. However the 200 MHz band is from 230-260 Mhz. The 2 meters portion works great and is in the U.S. Amateur portion of the band, but the 200 MHz band of this UV5R isn't. Is there a way I can modify this rig to lower the 200 MHz portion on this rig to the U.S. Amateur spectrum of 220 MHz band?

There should be no need to modify your radio. The Baofeng VIP software
allows you to set your band limits from 200 - 260 MHz and CHIRP lets you
set your band limits beyond that (but you can only enter frequencies from
220 - 260 MHz in the memory spreadsheet editor.

BUT asking a question is polite, good amateur practice (something you obviously know nothing about), and legal. As compared to kerchunking which is rude, contrary to good amateur practice, illegal, and will get you banned from many repeaters once you are identified.

While this is true of analog FM repeaters, it's become acceptable on Digital Voice repeaters, since those (at least it's true of D-Star) have a way of identifying the user built into the digital signal; this doesn't mean that the requirement to verbally ID is gone for them, since the purpose of the user callsign embedded in the digital signal is not what many of them think.

That is why I do NOT post on this site that much, as I see some Ham's acting like children.
Just about all on this site keep going on about FCC rules.
I do not know if you all know, more to this world than the USA.
If this is the way that hams go on, I am only too happy that I have NOT gone down that road.
I am quite happy been a radio enthusiast than been a radio ham.

There are tri-band HT radios such as the Kenwood TH-F6A, but to the best of my knowledge at this time there are no tri-band Baofeng radios capable of operation on the 2m, 70cm and 222 band (1.25m).

EMAIL TO BAOFENG

Gentlefolks:

I am trying to help a fellow Amateur Radio Operator fix a problem we cannot resolve. The radio when you turn it on the radio keeps saying and displaying the word COPING COPING COPING COPING. I tried a hard "reset all" and could not get into the menu. One time I did get into the menu and I got to the "reset all" menu and I was locked out. I really like your radio it is very durable. I have a uv-5r just bought another one it will be here on Wednesday with the 3800 m/a battery.

This weekend I dedicated the radio to a 500 person bicycle tour using the 5r as a transmitter attached to an out tracker that would beam my position onto a Google map. That way support could find me quickly. The attachment shows my track over the 100 mile course. I never had a hicup, another words it never failed.

Lastly I hope you can give us the fix if not can you send us a new radio, it was only one week old. This weekend I put my 5r thru a heavy duty cycle using a battery elimator attached to a 7.7 ah battery.

Put in Google search box APRS.FI then in the box in the upper right corner you see another box type in W1ABT-4 you should see me come up.

Thank you again group.

I just receive a new ARRL 2013-2014 Repeater directory and it has an entire section dedicated to the emission of the "Long Term Zero". Has anyone in North America ever tested/used their Baofeng to broadcast a Long Term Zero in an emergency? Is that just a matter of hitting the zero key while pressing the PTT?

Unless you bought your radio from Baofeng they aren't going to replace it. That's your dealer's responsibility.

It sounds like the EXIT key is kind of stuck or broken.

I can duplicate the flashing COPING by holding down the EXIT key. Does your EXIT key have a firm click to it or does it fell mushy compared to the others?

This is an email I just sent to Baofeng in China maybe someone can help me out there? Thank you in advance.

EMAIL TO BAOFENG

Gentlefolks:

I am trying to help a fellow Amateur Radio Operator fix a problem we cannot resolve. The radio when you turn it on the radio keeps saying and displaying the word COPING COPING COPING COPING. I tried a hard "reset all" and could not get into the menu. One time I did get into the menu and I got to the "reset all" menu and I was locked out. I really like your radio it is very durable. I have a uv-5r just bought another one it will be here on Wednesday with the 3800 m/a battery.

This weekend I dedicated the radio to a 500 person bicycle tour using the 5r as a transmitter attached to an out tracker that would beam my position onto a Google map. That way support could find me quickly. The attachment shows my track over the 100 mile course. I never had a hicup, another words it never failed.

Lastly I hope you can give us the fix if not can you send us a new radio, it was only one week old. This weekend I put my 5r thru a heavy duty cycle using a battery elimator attached to a 7.7 ah battery.

Put in Google search box APRS.FI then in the box in the upper right corner you see another box type in W1ABT-4 you should see me come up.

Thank you again group.

That's by far the easiest way to do it. However, be advised that SOME repeaters listed exist only on paper.

To K5DDJ:

You can also go here
http://www.repeaterbook.com/repeaters/prox.php#sthash.ZZeHvc57.dpbs

I downloaded by PROXIMITY based on my zipcode.

You can download that list as a CSV file, massage it in Excel and import
it into Chirp and upload to your radio.

As others have noted, not every repeater listed is really on the air.

After listening for several weeks, I cut my original list down to about
30...even that is probably too long for where I live.

Regards,

Ed

There are always those who feel they must be the aether police. They come and go ... there's one at the moment, there was another a few months ago who has thankfully since disappeared, I dare say the current wazzock will get bored at some point and his (her?) place will be taken by another.

>
> I do not know if you all know, more to this world than the
> USA.

They know, but perhaps they don't believe.

>

> have NOT gone down that road.

I'm happy to say that most of us are not like that; the vast majority are happy to inform, advise, help, and leave the authorities (or perceived authorities) to do their work as they see fit.

The funny thing is, they might be quite nice in real life! Some years ago, there was an amateur who, on packet and internet fora, was a nasty piece of work: racist, homophobic, rude, etc. I happened to talk to him on air once, during a Special Event station I was involved in (and to which he had objected strongly in his writings), and to my surprise he was as nice as pie and wished us well! Strange.

On the other hand, some paople are just nasty! Oh well.

>
> I am quite happy been a radio enthusiast than been a radio
> ham.

Don't give up hope completely; pay your local club a visit, see what they've got. Remember, the more people like you and me in the hobby, the less room there will be for the self-appointed bigwigs!

Of course, I'm an enthusiast as well; my interest in radio began long before I knew about amateur radio and extends far beyond it

- even out to the North Sea! :-)

Actually I'm not radio police as I have no legal power to be so. I have no way of stopping someone from using the radios as they see fit. However I can, and will continue, politely inform members advocating or commenting about using these on services here in the USA they are not certified for. Though, just as with anything else, in the it is up to the end user to decide to obey, or disobey, the rules. And just like many other crimes, getting caught can cost you a lot.

Hams SHOULD be aware of the rules. Not everyone coming on this group is a ham. Their not knowing the rules can cost them alot more than the $30.00-50.00 they spend on a radio. Personally, I am glad some people are not hams.

Ham radio is just adult children playing two way radios.

I have a ham licence but do not transmit.
The licence gives me the legal right to own equipment which would otherwise be illegal to own and I may get back on the air one day.
Ham radio is not all bad.

Richard, re the UHF/VHF settings:

My unit for VHF was preset at 136MHz low, 174MHz high.
UHF was 400MHz low, 512MHz high. (might have been 480MHz high, it's been a long time since I've changed VFO settings)

Cheers

Yes, holding the PTT then pressing & holding the zero key for several seconds is all that is required. Generally the time to hold the zero key is considered at least 3 but not more than 10 seconds – then you immediately begin your voice call describing your location and the nature of your emergency.

Despite the hoopla about LiTZ, there are relatively few places where anyone is going to particularly notice it. Whether you are on a repeater or on a simplex frequency, most of the time the LiTZ is just tone to give people time to think “Gee, what’s that?” but it accomplishes even that much only if someone happens to be listening to the frequency you are using.

You might happen to be in a location where some local ham has built one of published circuits that lets people leave a radio on at night but keeps the audio muted until it hears the DTMF 0 for several seconds; but like 99% of “good ideas” LiTZ has never caught on in most places.

Trying LiTZ certainly won’t hurt (unless your battery is already very low) but don’t expect it to accomplish any magical improvement in your situation unless you just happen to be in one of the very few places where it is actively supported.

The power would have to be changed using which ever computer program you
are using to set up the radio. Is it safe for me to assume that you are NOT
in the USA and therefor not under the rules of the FCC? Because if you are
in the USA the radio shouldn't be used to transmit in the 155 MHz band.

Hi Richard,

It varies depending on when you received you received your radio. For most new radios it would be 136-174 MHz and 400-520 MHz. To know for sure, just remove the battery (it's printed on the label).

They have a Receive PL tone (or Receive DCS Code) set and you are not transmitting that tone or code.

Subject: [baofeng_uv5r] Only heard after recipient keys 1st

Hi, I have a UV5R+ I'm having a transmit problem I need help with.
I have the rubber duck and an RH771.

Receiving works perfectly.
But when I try and transmit on VHF to my friends who have Motorola in car units they are unable to hear me. Their radios detect my transmission, but no voice is heard - it's totally silent. This is the same with both external mic and the built in mic.

The only way I can get them to hear me is immediatly after they key for the first time. Right after they transmit for the fist time, I can hear them perfectly and I can also transmit and receive fine after than.

We also noticed that after a length of time, my uvr5 reverted back to not being heard again, and I was only heard again after they keyed one time.....like something had woken up.

I've tried a full reset & running on low power and wide/narrow, but it hasn't helped, I can only be heard after the first time they transmit.

Any ideas would be gratefully received.

Thanks, Jay

36529. Channel 0 gone and I didn't do it.

My radio was on most of the day and I'm sure the battery was getting low. Turned it off and put it in the charger. The next morning I turned the radio on and channel 0 was GONE. No problem to re-add, but I don't know how or why it happened.

Anyone seen this before?

36530. Repeater setup

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

Hi Owen,
Are you really programming the radio? Via software or keypad? For testing purposes...try this

When you call up a repeater, typically for non simplex, you will see the frequency on the radio display change. Does it? If not you need to put in the offset. Also, do you hear anyone talking? Also when you let up on the PTT switch you should hear the squelch break and or in some cases, the repeater ID. Do you hear that?

There are some procedures listed in the files section on this...First find out if the repeater requires a PL tone or not. Is your club repeater 2m or 70 cm? You can put in the receive frequency of the repeater by selecting Frequency mode then using the keypad put in the repeater receive frequency. Next use the MENU options to add the PL tone (if needed) and then put in the offset (a must) typically 600 for 2 meters in TRANSMIT CTCSS mode and not REC CTCSS.Then add the + or - for plus 600 or minus 600 offset. This sets up the correct transmit frequency the repeater listens on.

To program CHANNELS...there is also documentation in the files section on using software, driver software and a cable to program the radio via a computer... all the above is detailed in various documents here in the files section. One of the big differences in using the program is there is NO offset option like on the radio menu. You need to add in the receive frequency then the transmit frequency which you need to do the math for + or - "offset" as defined by the repeater. Also one real gotcha in the Bao Feng software- it took me a while to figure out is the option to add the CTCSS or PL tone. You only need to use the CTCSS ENCODE and not the DECODE. Some software automatically plugs the DECODE (PL tone) in when you put the PL Tone in the ENCODE. So now the radio will connect to the repeater BUT it will wait until it receives a code from the repeater which most don't send...so you don't hear anything.
All the above is off the top of my head. For programming via software make sure you have lots of time, read the User Guide in the file section- much much better than the China version, a fully charge battery and a few gin and tonics!

Indeed, as do I. However, I will then consider them informed and
able to make a decision, and go on to answer their question,
rather than, as some people do, flog it to death.

Can you talk to the police with a UV5? Yes. [1]
If you do, will you get arrested? Very probably. But it's up to
you. Police radio specs are as follows.

[1] Of course, now it's all digital, you can't. But you could.
You could also walk round with the local fuzz emanating from your
lapel - but it's not something I'd reccommend unless you want
your collar felt. (Or, depending on where you live, unless you
want to get shot).

Jim or anyone having problems "losing" the Prolific driver for the Bao Feng SW? I installed the suggested driver and software... Followed all the instructions...programmed 3 radios and a week or so later the driver (Prolific) in ports section is gone! This is the second time this has happened. Nothing has changed on my computer. So now I need to install the device drive again.

I don't know what driver (just that I'm using the windows 7 version) I used as I'm on another computer but seems I need to review the driver pages in the files section again. Seems this is part of Windows & updating drivers without me knowing it???

Windows 7 and I think 8, have a passion for updating drivers. Prolifiuc rely upon that trait to get its clone detecting version of the driver out into the world. It sets the bait and relies on Windows to cast it on the tide.

Yes. This has been reported before. But to the best of my recollection, only after Baofeng came out with BFB291 firmware did we begin to hear of this happening.

I would restore from a previously saved image of the radio's channels and see what happens. If that doesn't take care of it, then I would try the "Recover from Erratic Behavior" procedure on the Miklor.com website.

This has been known to happen to some of these radios. Generally only channel 0 and/or channel 1. In most cases, once the channel is reprogrammed, it doesn’t disappear again. I think we have heard of one or at most two cases where this has been a recurring problem. To the best of my knowledge, no one has ever figured out what causes the problem or any sure way to prevent it.

Subject: [baofeng_uv5r] Channel 0 gone and I didn't do it.

My radio was on most of the day and I'm sure the battery was getting low. Turned it off and put it in the charger. The next morning I turned the radio on and channel 0 was GONE. No problem to re-add, but I don't know how or why it happened.

Anyone seen this before?

Ok, now that we know you are programming the radio manually, we are back to my initial question: What makes you think you are not using high power?

The radio defaults to high power. You would have had to change the setting to low power (in which case you would use the same menu to switch back to high power). The radio has an indicator on the top line of the display for Low power, but there is no icon for high power because the radio is always in high power unless you have programmed it to low power.

I guess someone needs to add this to the FAQ because 90% of new users seem to keep asking this question. And I expect that number will go up to 100% now that it is more difficult to search the message archives.

The reason you cannot save an offset is because the radio does not use any offset in memory mode.

The radio stores the receive frequency and the transmit frequency separately (which is why you needed to save the receive frequency first then had to save the transmit frequency as a separate step).

If you look at the display while in memory mode, you will notice that instead of showing either a + or a - for the offset direction you will see that the display shows both the + and the - which is what most ham radios use to indicate a memory channel with the receive and transmit frequencies set separately rather than as a standard offset.

You will need to completely delete the channel number where you saved the settings for that repeater, then program the channel again from scratch.

I strongly urge you to look at the manual programming instructions on the Miklor website. You will find what look like at least three different sets of directions. They are actually all the same process with the same steps so it doesn't matter which set of manual programming instructions you follow but they are just written a bit differently so just look over the sets of instructions and pick the set that seems to make the most sense to you because that will make it easier to follow the steps. Be sure that you do follow them carefully - one step at a time - if you try to read ahead and do more than one step at a time you are more likely to miss something.

Xaun,

I know what you mean. I've lost track of how many times you and I (and
others) have answered these questions. Sometimes multiple times in a single
day!

It's too bad the menus aren't disabled in some way when they are not valid
and/or read only. But when a user accesses an invalid menu (say to adjust
the power level of a channel in memory mode) the radio lets you got through
the motions and ends with a "confirmed" which incorrectly assures the user
that the change was successful. It shouldn't even allow access to the
settings or at the very least report "cancel" at the last step.

But I agree, a FAQ for "shifts and offsets", related to that a FAQ for the "+-" indication and a FAQ for "I changed menu {your choice here} and it didn't save" would at least allow us to point the user to that FAQ instead of repeating the same answers over and over and over...

Glad to hear that I'm not crazy.... well maybe.
Anyway, no image files for me. I have been programming by hand and have found that it's not that bad.

Right after it happened, I suspected that it might have something to do with that magical channel number of "0". So, I programmed our main repeater in channel "5" as well.

Anyone seen this before?

Yes. This has been reported before. But to the best of my recollection, only after Baofeng came out with BFB291 firmware did we begin to hear of this happening.

I would restore from a previously saved image of the radio's channels and see what happens. If that doesn't take care of it, then I would try the "Recover from Erratic Behavior" procedure on the Miklor.com website.

Set "Tone Mode" = "(None)" # You don't need PL just to listen
Set "Duplex" = "off" # So you can not accidentally TX on this frequency

The above will allow you to monitor any signals that are on this frequency.
The UV-5R can only understand analog (FM) signals. Any digital (P25)
transmissions will probably sound like static.

It likely that dispatch switched to P25 transmissions only and the FM
information listed is outdated. However if they do transmit both,
continue...

482.4125 (analog only)
Set "Tone Mode" = "TSQL"
Set "ToneSQL" = "146.2"
Set "Duplex" = "off" # So you can not accidentally TX on this frequency

Assuming that dispatch does on occasion transmit analog signals and that
when they do they also transmit the 146.2 Hz CTCSS tone, then the above

would allow you to hear the analog (FM) signals and ignore the digital (P25) signals.

Roger, Try this. . .
Go to Windows START / All Programs / Open the CHIRP folder / Right Click on the CHIRP Program Icon
Select Send To / Desktop (create shortcut)
You may just have a dead icon link.

Subject: RE: Re: Re: [baofeng_uv5r] CHIRP Software

Hi Jim...I did install 0.3.1 and the same problem. It installs, no problem. Shows up in the all programs list but when you click on it nothing happens...no errors, nothing to indicate something is wrong. I'm lost as to where to go now. It worked before on my Win 7 32 bit machine but can't get it to run on the 64 bit. Thanks for your help. 73, Roger

Hi Jim...running Win 7 Home 64 bit. I downloaded two files. The first was the driver (Prolific 3.2.0.0.)
The second was (chirp-daily-2013031-installer). When I run the installer it appears to install, it shows up on the start menu but when I click on it nothing happens. Thanks.

That's the same setup I have at my QTH. Just for the fun of it, install the v0.3.1 stable build. Try it. Then if it works, install the latest daily build.

If and only if you are running 64 bit Windows XP, then and only then are there no identified working drivers as yet for the cloned Prolific USB cables. My first thought was; do you have administrative rights to install and use the program. Apparently install, but did were the rights to use it set properly?

As I shift to Linux over the next few months I expect to deal with a few other issues, but Chirp seems to work OK so far. 64 bit Windows XP does work OK with a serial cable with Chirp and the factory software for all 3 of my Chinese radios.

Mike,

I'm slowly still learning my HAM skills. I passed the Tech test, but really felt that it left me un-prepared for the real world.

That being said, I've seen your test link below, or others like it a few times, but really don't understand how to read it.

>Joey Scallops aka Charlie
>482.4125 (analog and digital)

Set "Tone Mode" = "(None)" # You don't need PL just to listen

Set "Duplex" = "off" # So you can not accidentally TX on this frequency

The above will allow you to monitor any signals that are on this frequency. The UV-5R can only understand analog (FM) signals. Any digital (P25) transmissions will probably sound like static.

It likely that dispatch switched to P25 transmissions only and the FM information listed is outdated. However if they do transmit both, continue...

482.4125 (analog only)

Set "Tone Mode" = "TSQL"

Set "ToneSQL" = "146.2"
Set "Duplex" = "off" # So you can not accidentally TX on this frequency

Assuming that dispatch does on occasion transmit analog signals and that when they do they also transmit the 146.2 Hz CTCSS tone, then the above would allow you to hear the analog (FM) signals and ignore the digital (P25) signals.

Mike,

Thanks a lot. I happened to get the Expertpower 14.5 anntenna when I got my Baofeng. I ended up spending a lot of time on the 2m though, and everyone says it's hard to hear me. I think I'll be going out get the Diamond.

Thanks again.

Chris

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

There’s a lot to learn.

Antennas are normally rated by “gain” which shows the MAXIMUM gain in a direction from the antenna that they almost never tell you.
Some antennas you can find a radiation pattern for them which will tell you the direction of maximum gain.
Imagine an antenna though with lots of gain but it all goes straight down. Not very useful, eh? So gain alone does not tell you how well an antenna will perform for you.
So you have to be wary of “gain” numbers by themselves.
My testing shows antennas (many of which are rated the same gain) have wildly different performance characteristics for my test setup.

To read the chart it is already in order of “best” to “worst” for VHF at the tested frequency (note that performance may vary on other frequencies which I hope to test in the future).
The higher the dB numbers the better the test result. For example, the best UHF was the ExpertPower with no model# associated with it at -8.7dB

If you have questions please feel free to ask or email me privately if you wish.

I do believe it may not be obvious but red items are extendable antennas, blue are mobiles, and black are rubber ducky/whip models.

Mike W9MDB

36587. best battery charging cycle?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: Gary Dunn
Topic: 36587 Message: 36587

Assuming a newly-purchased battery, either 1800 or 3800 mAh, what is the best way to put it into service?

I have the idea from reading this group that 3 complete charge/discharge (c/d) cycles are the best; that is, place on stock charger until green light indicates full charge, then use until radio powers-down before charging again.

If correct, after 3 c/d cycles, is it then best to recharge the battery before a complete discharge is achieved, or does it matter?

uv-5r_v1.0-annotated_by_KC9HI.pdf has been consulted before asking.

If you let the radio run until it shuts off that’s around 6V on the battery.

So that is a good way to discharge it.

I understand the UV-5R variant radios will self-power-down before the battery is completely discharged? How many cells does the battery contain? How are you measuring the per-cell voltage with usage?

36596. Re: [baofeng_uv5r] best battery charging cycle?

The battery contains 2 cells at 3.7 volts per cell 7.4v total
It will charge higher than that. usually 8.4 Volts
I just use a cheap (Harbor Freight) voltmeter to measure it.
I fly RC planes and use Lipo batteries and charge them on computerized chargers.

I just read this part on Amazon WHICH describes my manually programmed issue successfully.

This should ALSO BE IN THE MANUAL BUT IT IS NOT. Someone with Miklor connections, please make this manual programming suggestion. TYVM

Programming repeaters into the UV5R Plus:

Menu numbers: 35,36,37, set to off

You must enter all of your frequency channels in frequency mode on the A.

Enter your frequency.

11- CTCSS tone (receive) Not normally needed, Some repeters may require it.

13- CTCSS tone Transmit. (You will need t0 enter this)

25- Offset (+ or -) This is required for the radio to switch between receive and transmit.

26- Offset value (00.600) @m 144.000 or (05.000) 70cm 440.000. Make sure to set this depending on the frequency.

27- program into memory channel.

VERY IMPORTANT Once you program this information to a memory channel go back to the frequency cannel setting and the channel you just programmed and hit the scan button quickly. You will see an "R" in the display. When you see that, save that channel to the same channel number you just programmed and your offset channel wil be put in!!

h/t Don't be afraid of the blue!!, July 19, 2013

>
These menus have nothing to do with memory channel programming. They are
global and can be changed at any time. The Miklor.com quick menu reference
and the "Reference for UV-5R Menus" (look for Menu Detailed Reference) both
recommend setting these menus to OFF .

>
> You must enter all of your frequency channels in frequency mode on the A.
>
This is covered in the both the Miklor.com text guide and the graphic
flowchart guide.

>
> Enter your frequency.
>
> 11- CTCSS tone (receive) Not normally needed, Some repeters may require it.
>
Nothing can ever require you to use a receive CTCSS tone or receive DCS
code. OFF always works. This is also covered in the "reference" mentioned
above.

>
> 13- CTCSS tone Transmit. (You will need t0 enter this)
>
Only if the station your are transmitting to requires it to open it's
squelch. Otherwise, it can be set to OFF.

>
> 25- Offset (+ or -) This is required for the radio to switch between
> receive and transmit.

>
This has nothing to do with being able to switch between RX and TX.

This setting is not required. It sets the direction of any shift relative
to the RX frequency and is only needed in VFO mode when using a repeater.

>
> 26- Offset value (00.600) @m 144.000 or (05.000) 70cm 440.000. Make sure
> to set this depending on the frequency.
>
This setting is also not required. It sets the offset value (or difference
between the RX and and TX frequencies) and is only needed in VFO mode when
using a repeater.

>
> 27- program into memory channel.
>
> ***VERY IMPORTANT*** Once you program this information to a memory channel
> go back to the frequency cannel setting and the channel you just programmed
> and hit the scan button quickly. You will see an "R" in the display. When
> you see that, save that channel to the same channel number you just
> programmed and your offset channel wil be put in!!
>
When menu 25 and menu 26 have been properly set, you can tap the [SCAN] key
to put the radio in reverse mode. This conveniently displays the TX
frequency so it can be saved to the target memory channel to complete the
programming of a repeater channel. This is covered in both manual
programming guides (text and graphic flowchart) on the Miklor.com website.

Except for being able to utilize reverse mode to display the TX frequency,
menu 25 and menu 26 have absolutely no bearing on programmed memory
channels. The user could have just as easily keyed in the TX frequency,
eliminating the need to set menu 25 or menu 26 and eliminating the need to
enter reverse mode. I keypad programmed about 20 repeater channels for a
friend once and never once utilized menu 25, menu 26 or reverse mode.

And programming a channel with a RX/TX frequency split wider than 69.99 MHz
(which is possible for a UV-5R) can't be done using menu 25, menu 26 and
reverse mode.

Or

Type in receive frequency, save to an unused channel, exit
Type in transmit frequency, tone if necessary, save to same channel as you did the receive frequency, exit.
You're done.

I have never used the CHIRP software. However; after trying to run it, can you try looking at Windows 8 Event Viewer to see if there are any errors?

Also read where someone else mentioned Admin rights - have you tried right clicking on the program and selecting "run as administrator"?

Not sure any of it will help, but you never know!

Hi Jim...I did install 0.3.1 and the same problem. It installs, no problem. Shows up in the all programs list but when you click on it nothing happens...no errors, nothing to indicate something is wrong. I'm lost as to where to go now. It worked before on my Win 7 32 bit machine but can't get it to run on the 64 bit. Thanks for your help. 73, Roger

36611. Max power output

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-15 14:46:42 UTC
From: <plaisaeb@...>
Topic: 36611 Message: 36611

I have been fairly active now that I have the Browning antenna on my minivan, and it seems everyone and his cousin has one of these UV-5Rs. And I hear all sorts of claims on how much wattage they put out. I figured they can't all be right, so I went to the source of the certification info for FCC Part 90 and here is what I found:

For extensive testing done at an FCC approved facility in China click on Test Report https ://apps.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&RequestTimeout=500&calledFromFrame=N&application_id=392511&fcc_id=ZP5BF-5R

On page 50 you will see the maximum output is on the bottom of the UHF band at 31.51dBm. This equates to 1.42 watts. (BTW, ZP5BF-5R is the FCC identifier for the UV-5R.)

For testing done in Germany for the Grant of Equipment Authorization Certification see https://apps.fcc.gov/oetcf/tcb/reports/Tcb731GrantForm.cfm?mode=COPY&RequestTimeout=500&tcb_code=&application_id=392511&fcc_id=ZP5BF-5R

The maximum measured here was 1.78 watts.

So, for what it is worth, our favorite HT has not been shown to produce more than 2 watts. However, that and a good antenna will get you 20-40 miles.

Regards,

Ed

I just measured my UV-5R with an MFJ-842 and MFJ-260C and I show just under 1.5W on UHF high power.

I won't try and claim a whole lot of accuracy but "close enough" for our discussion here.

So I would tend to agree with the FCC testing vs the Bird wattmeter on the UHF portion.

But I show about 5.3W on VHF and the ~31dBm measurement on the FCC test is 1.25W which I don't believe.

I show VHF low power at 1W so maybe they tested the thing in low power mode.

I think it's pretty well known that VHF is more than twice the power of the UHF side so the FCC test doesn't make a whole lot of sense unless they did low power on VHF.

First one point. There is NO "FCC testing" for this or any other radio approved in the last decade or two. I don't recall the exact date that the FCC stopped doing their own testing, but it was before many members of this group were born.

As Ed mentioned, the testing for this radio was done "at an FCC approved facility in China" which in this case was the "SHENZHEN TIMEWAY TECHNOLOGY CONSULTING CO., LTD"

The problem isn't who did the testing -- the problem is that people are talking about apples and oranges!!

Ed says "On page 50 you will see the maximum output is on the bottom of the UHF band at 31.51dBm. This equates to 1.42 watts." which is true, as far as it goes. But what no one seems to be noticing it that the test described on page 50 has nothing to do with the RF power output of the radio!!!

The test on page 50 is for EIRP (Equivalent Isotropically Radiated Power, AKA Effective Isotropically Radiated Power) which is the amount of power that a theoretical isotropic antenna (which evenly distributes power in all directions) would emit to produce the peak power density observed in the direction of maximum antenna gain. The test procedure is described in the report, but the bottom line is that this is a completely different test from just measuring the power output at the antenna connector -- the numbers in the report are the effective radiated power of the radio (taking into consideration the loss that comes from the supplied rubber duck) and modified to represent a theoretical isotropic situation.

To simplify the discussion, the numbers in the test report approximate what you would be getting out of the stock antenna, not what you would be feeding

into it.

The correct directions are already on the Miklor website. The directions you just posted from Amazon are wrong in several places – if you follow the instructions you just posted you will NOT successfully program the radio.

Subject: [baofeng_uv5r] RE: Transmit from programmed channel

I just read this part on Amazon WHICH describes my manually programmed issue successfully.

This should ALSO BE IN THE MANUAL BUT IT IS NOT. Someone with Miklor connections, please make this manual programming suggestion. TYVM

Programming repeaters into the UV5R Plus:

Menu numbers: 35,36,37, set to off

You must enter all of your frequency channels in frequency mode on the A.

Enter your frequency.

11- CTCSS tone (receive) Not normally needed, Some repeters may require it.

13- CTCSS tone Transmit. (You will need t0 enter this)

25- Offset (+ or -) This is required for the radio to switch between receive and transmit.

26- Offset value (00.600) @m 144.000 or (05.000) 70cm 440.000. Make sure to set this depending on the frequency.

27- program into memory channel.

VERY IMPORTANT Once you program this information to a memory channel go back to the frequency cannel setting and the channel you just programmed and hit the scan button quickly. You will see an "R" in the display. When you see that, save that channel to the same channel number you just programmed and your offset channel wil be put in!!

> sounds like you need a 'foldover'. if you get water in the connector
> with the antenna off the mount, you could be asking for problems.

NMO mounts are nearly waterproof.

With the antenna only removed when the vehicle in entering the garage and installed as soon as the vehicle leaves the garage, there is almost zero chance of getting water inside the mount

If there were any concern, it would be simple enough to simply get a NMO cover and use it when he didn't want to have the antenna mounted. A screw-on cap for the NMO mount costs under $4 (with free shipping) on eBay or under $2 (plus shipping) from some online sellers. I have often seen them for $1 or less at hamfests.

It was a Baofeng lead off flea-bay from China, it did;nt want to work even after spending an hour installing and reinstalling the drivers. I went and made a coffee came back went onto the files section, read the pdf by KC9HI and got it sorted. Now I can realy use the radio .

>Is there a way to actually program a 2M and 70CM radio for 1.25M
>usage? Andre H KD2EQZ

You could probably program it, but
would it work? NO.

The RF circuits in the radio are built for
either 2m and 450, or 2M and 222 MHz.

Changing it is not worth the effort.

If you want a 2m / 222 radio then buy
another radio. They are cheap enough.

One local guy has three UV5s... a black one for
amateur radio channels, a yellow one for railroad,
and a red one for public safety.

The best blogs for HAM radio is definitely what you want when considering target repeater height for maximum radius distance. Internet blogs + WWW user with access = world coverage / maximum radius distance (sans elevation as a factor). ;)

Poll Starter: you really have three different questions and a "Poll" is the most difficult way in which to answer those questions. The first two questions can be answered with fact/science, the third question with opinion.

I recommend starting a regular conversation thread with your questions in this group, or Google searching your questions one at a time, for example: "HAM radio blog sites," HAM radio forums, amateur radio blogs, etc...

Pushing the scan button after entering the receiving frequency into memory reveals the transmitting frequency. The radio still cannot scan CTCSS codes with the method indicated in the Miklor site.

I just read this part on Amazon WHICH describes my manually programmed issue successfully.

This should ALSO BE IN THE MANUAL BUT IT IS NOT. Someone with Miklor connections, please make this manual programming suggestion. TYVM

Programming repeaters into the UV5R Plus:

Menu numbers: 35,36,37, set to off

You must enter all of your frequency channels in frequency mode on the A.

Enter your frequency.

11- CTCSS tone (receive) Not normally needed, Some repeters may require it.

13- CTCSS tone Transmit. (You will need t0 enter this)

25- Offset (+ or -) This is required for the radio to switch between receive and transmit.

26- Offset value (00.600) @m 144.000 or (05.000) 70cm 440.000. Make sure to set this depending on the frequency.

27- program into memory channel.

VERY IMPORTANT Once you program this information to a memory channel go back to the frequency cannel setting and the channel you just programmed and hit the scan button quickly. You will see an "R" in the display. When you see that, save that channel to the same channel number you just programmed and your offset channel wil be put in!!

So far you are Oh For Two, Michelle.

The directions for scanning CTCSS tones as listed on the Miklor website does work. You just have to do two things that so far have eluded you:
1) Read the Directions
2) Follow the Directions.

Apparently Zippy knows about as much about NMO mounts as he does everything else – namely nothing.
Clearly he has never even seen an NMO mount or he would know that it is totally different from an “n connector”
Perhaps he should keep his comments to something he knows something about.
From: ZIIP
xaun loc must mount his ants upside down to not get water in them. i mount mine right side up and they hold water quite well when the antenna is off the mount. n connectors are water proof only when connected, when not connected water will lay in the exposed part and create a 'short' between pin and ground. since last time i checked, water does conduct, and acid rain conducts even more.

related to charging batteries, I was thinking about buying a "spare" 3800 battery and storing it for back up....but the question that pops up is....how long will it last while being "stored"..???

another way of looking at this is if you have spares, other than rotating them every...xxxxx.....day/weeks....whats the best way to keep them in good condition and relatively full??

Why does everyone recommend not using squelch tail elimination?
I personally hate squelch bursts.
STE WILL make your unkey silent on any repeater,and most ham repeaters are modified commercial equipment and they all implement STE,so no squelch burst when the repeater unkeys.
This all makes for a pleasant rag chew session with only voice heard and no kerchunks.
Now,if only they would set the hang timer for the longest possible,so that a rag chew is continuous receiver quieting.
Just my opinion as a ham/GMRS repeater owner and technician.

Reason 1: Menu 35 (STE) is for simplex operation only between radios that have this feature (UV-5R, UV-B5/B6, UV-82, etc.). When the transmitting station releases the [PTT], a short 50 Hz tone burst is transmitted before the carrier is dropped. The other radios in range that have this feature enabled, 'hear' the burst and immediately close their squelch preventing them from hearing the tail drop. This menu should always be OFF when communicating through a repeater. Menu 36 and menu 37 should be OFF when this menu is ON.

Reason 2: Reverse burst or Squelch Tail Elimination ("STE") is a process that uses a change of the phase of the PL tone encoder for a short period of time before the repeater tail drops. The term "reverse burst" is used to describe the deliberate phase change for a specific amount of time while the transmitter carrier stays on - about 150 to 200ms - with the phase of the PL encoder offset by from 120 to 180 degrees. Motorola shifts the tone phase by 120 degrees for about 180 milliseconds, Kenwood and the other manufacturers shifts the phase of the tone by 180 degrees for about 150 milliseconds. Both menu 36 (RP-STE) and menu 37 (RPT-RL) should be adjusted for each repeater.

Reason 3: Menu 35, 36 and 37 are all global settings (not stored on a per-channel basis). That means you would constantly have to manually adjust these settings as you switch channels.

Reason 4: Having these menus enabled slows the transition from TX to RX. This is a problem for some modes like working satellites or packet.

Since OFF always works and requires no further attention from the user, it will always be my recommendation for these three menus. However, there is nothing wrong with enabling these menu if you feel you benefit from their

use.

I have one and like it... well almost.

It has good band width and tunes well. But I personally do not like fold over antennas, that’s my only dislike.

Beware, it is very stiff. You hit a tree with it and it will not bend over. If on an NMO mount, it may break the mount, and tear it right out of the roof... got the “T”shirt to prove it.

I would suggest 300 ohm twin-lead like was once popular for TV antenna lead-ins. It is a bit hard to find locally, but a 50 foot roll will yield several antennas. I suppose you could tape the tape measure to a pipe or dowel for a J-ple or Slim-Jim, but I just don't see a way to make it work well free standing.

Subject: [baofeng_uv5r] Chameleon VHF/UHF Antenna for mobile

Hi,

I found a great antenna to use mobile with the UV5R. It's the CHA VHF/UHF Antenna from Chameleon Antenna:

http://chameleonantenna.com/MOBILE%20ANTENNA/CHA%20VHF_UHF/CHA%20VHF_UHF.html http://chameleonantenna.com/MOBILE%20ANTENNA/CHA%20VHF_UHF/CHA%20VHF_UHF.html

Specifications:

Frequency: VHF: 144 - 148 MHz (Unity Gain) UHF: 430 - 470 MHz (2.5 db Gain)

Power: 150W FM

RF Connection: 3/8-24 Thread

VSWR: Subject to configuration

Height: 17"

Weight: 1 Lb.

Mounting Configuration: 3" Mag-mount threaded for 3/8-24 & 12' of RG-58 coax cable

The only thing that you need is a connector adapter SMA-F to SO-239 that you can find anywhere online and on Ebay for very cheap:

SMA-F to SO-239

http://www.ebay.com/itm/UHF-SO-239-female-jack-to-SMA-female-RF-straight-connector-adapter-/151008098708 http://www.ebay.com/itm/UHF-SO-239-female-jack-to-SMA-female-RF-straight-connector-adapter-/151008098708

Is there anyone using it?

Thanks

-C

The UV5R only displays in channel number order.

CHIRP can sort by whatever you want…no relationship to what the radio displays.

So if you want name order you need to use the move up/down menu to re-order the channels by name (this will change the channel number).

36692. Fixing a Baofeng UV-5R LCD fault

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-17 19:49:05 UTC
From: <cq.8p6uk@...>
Topic: 36692 Message: 36692

My Baofeng UV-5R LCD cracked when I was climbing in and out of a car with the radio on my belt. I ordered the LCD, the perspex screen for the LCD, a replacement keyboard membrane (may as well replace the worn numbers while the unit is in pieces) and splashed out for the special tool to remove the slotted nuts on the antenna and volume control. I received the bag of parts and thought I would attack the UV-5R today.

I went online and found a YouTube video (http://www.youtube.com/watch?v=bVO6-DajyjQ http://www.youtube.com/watch?v=bVO6-DajyjQ) of the simple dismantle process, and managed to get the unit apart quickly It is very easy if you have the correct TORX T-8 and a small Phillips screwdriver bit. But when I got to the LCD, I was beginning to panic. When you dismantle the LCD bracket, you find that the LCD has two strips of something like graphite sandwiched in neoprene, which obviously extends the electrical connection from the copper pads on the PCB to the almost invisible pads on the LCD unit. The "step by step" instruction further down the page of the shop409 website was USELESS. Step 8 doesn't mention any of this delicate part of the operation!
http://www.409shop.com/409shop_product.php?id=108587
I was panicking because I could not see any obvious way to line-up the pads, and could not make out any individual connections on the little neoprene strips.

I re-assembled the components and prayed. Before re-assembling the unit, I carefully slipped the battery against the connector and turned the volume control. The display lit up perfectly, so I continued with the re-building. After slipping the new keypad membrane into place, I inserted the radio unit into the case. Again, I added the battery & antenna, and noted that the side buttons did not work (no transmit, no lamp/monitor).

I took out the keypad membrane and had to snip off a little excess plastic from the membrane which was interfering with the movement of the side buttons. Re-assembled again and hey presto, it works perfectly.

Does anyone happen to know how the little neoprene-like strips conduct the signals to the correct pads on the LCD?

Those strips have many areas of conducting and insulating bands so don't worry about it.

Subject: [baofeng_uv5r] Fixing a Baofeng UV-5R LCD fault

My Baofeng UV-5R LCD cracked when I was climbing in and out of a car with the radio on my belt. I ordered the LCD, the perspex screen for the LCD, a replacement keyboard membrane (may as well replace the worn numbers while the unit is in pieces) and splashed out for the special tool to remove the slotted nuts on the antenna and volume control. I received the bag of parts and thought I would attack the UV-5R today.

I went online and found a YouTube video (http://www.youtube.com/watch?v=bVO6-DajyjQ) of the simple dismantle process, and managed to get the unit apart quickly It is very easy if you have the correct TORX T-8 and a small Phillips screwdriver bit. But when I got to the LCD, I was beginning to panic. When you dismantle the LCD bracket, you find that the LCD has two strips of something like graphite sandwiched in neoprene, which obviously extends the electrical connection from the copper pads on the PCB to the almost invisible pads on the LCD unit. The "step by step" instruction further down the page of the shop409 website was USELESS. Step 8 doesn't mention any of this delicate part of the operation!
http://www.409shop.com/409shop_product.php?id=108587
I was panicking because I could not see any obvious way to line-up the pads, and could not make out any individual connections on the little neoprene strips.

I re-assembled the components and prayed. Before re-assembling the unit, I carefully slipped the battery against the connector and turned the volume control. The display lit up perfectly, so I continued with the re-building. After slipping the new keypad membrane into place, I inserted the radio unit into the case. Again, I added the battery & antenna, and noted that the side buttons did not work (no transmit, no lamp/monitor).

I took out the keypad membrane and had to snip off a little excess plastic from the membrane which was interfering with the movement of the side buttons. Re-assembled again and hey presto, it works perfectly.

Does anyone happen to know how the little neoprene-like strips conduct the signals to the correct pads on the LCD?

When you sort by name in CHIRP, you are only changing the order that they are displayed in the spreadsheet memory editor. The Loc number is now unsorted and it is the Loc number which corresponds to the channel number of the radio.

To do what you want, you would have to right-click each row to cut, insert, paste, etc to where you want it to be.

Another solution might be to export the spreadsheet memory editor to a .csv file so you can sort by names using a program what will edit .csv files (such as excel). Unfortunately some of your settings will be lost and have to be re-entered after importing the .csv file back into CHIRP.

It works well on Debian 7.1 Linux using a cheapo clone cable.

I have both the UF5R and the F-11. I am trying to use it to communicate at a sanctuary where I volunteer. They use kenwood Tk 2300/3300. They don't know the frequency but I found them by using an old scanner. I can pick them up at 484.2125 though reception varies and is scratchy at best. The scanner steps at 12.5 MHz so I figure they are .00625.

My problem is that I have set the F-11 at 484.20625, .2125, .21875 but get nothing. By process of elimination, I am progressing through the ctcss and dcs codes. Any ideas? Thanks.

Best regards,

Why would anyone screw around with tape measure material when the most common version of the J-pole is simply twin lead?
In case you have never noticed, metal tape measures are NOT especially flexible and tend to destroy themselves if folded or kinked.

:Reason 1: Menu 35 (STE) is for simplex operation only between ra=
dios that have this feature (UV-5R, UV-B5/B6, UV-82, etc.).:

Not correct,it will prevent a squelch burst on any radio or repeater that uses pl decode.I believe the STE on the uv5r+ just holds tx up with no pl for a bit.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote:

On Sat, Nov 16, 2013 at 5:12 PM, mod <n5tbu@...> wrote:

Why does everyone recommend not using squelch tail elimination?
I personally hate squelch bursts.
STE WILL make your unkey silent on any repeater,and most ham repeaters are modified commercial equipment and they all implement STE,so no squelch burst when the repeater unkeys.
This all makes for a pleasant rag chew session with only voice heard and no kerchunks.
Now,if only they would set the hang timer for the longest possible,so that a rag chew is continuous receiver quieting.
Just my opinion as a ham/GMRS repeater owner and technician.

Reason 1: Menu 35 (STE) is for simplex operation only between radios that have this feature (UV-5R, UV-B5/B6, UV-82, etc.). When the transmitting station releases the [PTT], a short 50 Hz tone burst is transmitted before the carrier is dropped. The other radios in range that have this feature enabled, 'hear' the burst and immediately close their squelch preventing them from hearing the tail drop. This menu should always be OFF when communicating through a repeater. Menu 36 and menu 37 should be OFF when this menu is ON.

Reason 2: Reverse burst or Squelch Tail Elimination ("STE") is a process that uses a change of the phase of the PL tone encoder for a short period of time before the repeater tail drops. The term "reverse burst" is used to describe the deliberate phase change for a specific amount of time while the transmitter carrier stays on - about 150 to 200ms - with the phase of the PL encoder offset by from 120 to 180 degrees. Motorola shifts the tone phase by 120 degrees for about 180 milliseconds, Kenwood and the other manufacturers shifts the phase of the tone by 180 degrees for about 150 milliseconds. Both menu 36 (RP-STE) and menu 37 (RPT-RL) should be adjusted for each repeater.

Reason 3: Menu 35, 36 and 37 are all global settings (not stored on a per-channel basis). That means you would constantly have to manually adjust these settings as you switch channels.

Reason 4: Having these menus enabled slows the transition from TX to RX. This is a problem for some modes like working satellites or packet.

Since OFF always works and requires no further attention from the user, it will always be my recommendation for these three menus. However, there is nothing wrong with enabling these menu if you feel you benefit from their use.

As I wrote, they do not know the frequency. These have no led readouts and they didn't program them. The radios were donated. Some shop in Kentucky did the programming. Came to them programmed. They just point it to one and talk. The thing is, as I understand ctcss tones, I should be able to at least receive them. But I can't.

I use a fold-up yaggi directional aerial made from a tape measure.
The aerial slips into a rectangular plastic rainwater pipe when folded up
The plastic 'scabbard' protects and makes it easy to carry in a vehicle. The aerial is VERY effective so this material should be suitable for 2M vertical.

To me, STE makes about as much sense as limiting repeater ID times to while it's in use and 10 minutes after the last transmission through it, at least for Ham repeaters. I'd prefer to see all Ham repeaters configured with PL passthrough so those that don't like the "talking repeaters" don't have to hear anything but actual transmissions through the repeater; this has the additional benefit of making over the air radio links to Echolink, IRLP and AllStar Link worth keeping linked full time, since the normal repeater ID doesn't pass through to the linking system.

For manipulating the list like that, consider exporting to CSV
format, opening that in Excel, doing whatever sorting, and then
importing back into Chirp, and then to the radio.

Most of the newer (and cheap) Chinese frequency counters will display both the transmit frequency and any PL tones, but you should not assume that the Kenwood units are all using simplex.

Hi Lawrence,

You could be picking up an image of the real frequency. An image is usually 2 times the intermediate frequency (IF) away from the legitimate frequency. A lot of FM receivers have a 10.7 MHz IF. My Bearcat scanner had a 10.8 MHz IF. So try scanning 21.4 MHz lower in frequency (roughly in the area of 462-463 MHz - GMRS territory... hmmm).

Another way to find frequency would be to look on the license that authorizes them to use it. Or look them up in the FCC database. Or ask the radio consultant that programmed the TK 2300/3300 radios.

Hi Alan,

It sounds to me like the [MONI] button on the left side of the radio or the one of the top row keys of the keypad (excluding the [MENU] key) are stuck.

Probably because the second line of the message you replied to stated that “They don't know the frequency”

That ought to be impossible, but unfortunately today it is almost certainly true because most small commercial radio users are actually unlicensed and are using radios obtained from a local radio store (which often also sells repeater service). Supposedly the radios are licensed to the radio dealer (which isn’t really legal, but no one at the FCC cares).

The answer to his problem is simple enough. Find the frequency by stepping through the likely possibilities. The only difficulty here is that according to his scanner they appear to be at or near 484.2125 which seems unlikely to be licensed – but from what he tells us in his later message it seems that the “Sanctuary” isn’t bothered with details like being licensed. Since Mr Coyne doesn’t have a ham license and his IP address is through Windstream, there is no way to tell where he might be located (which would help in guessing the likely frequency). His best bet might be to take advantage of the F-11’s glacially slow scan rate to do a scan at a 6.25 Step, starting from 484.99375 and scanning downward to try to find their frequency. (Even though the sanctuary is operating illegally, the radios are probably programmed on a valid channel).

Once he finds the correct frequency, he will be able to receive their radios even without knowing the CTCSS tone or DCS code. He can then use the radio’s ability to scan for CTCSS tones and DCS codes to determine what tone or code they are using.

Thank you for your reply. Turned out I was hearing an image and located the actual frequency by subtracting 2xIF. Thank you Jim.

You are correct that I do not have a Ham license but taking the Technician test on Dec. 7th. It's not that the sanctuary isn't bothered by licensing, but rather, they haven't a clue. They were using motorola talk abouts and think that's all there is to it. You get a radio, charge the battery, press the PTT and wallah. The radios were a donation from another sanctuary that was also unlicensed and unaware.

I am beginning the process to get a license for them. Thank you for your concern.

> That ought to be impossible, but unfortunately today it is almost certainly true because most small commercial radio users are actually unlicensed and are using radios obtained from a local radio store (which often also sells repeater service). Supposedly the radios are licensed to the radio dealer (which isn’t really legal, but no one at the FCC cares).
>
> The answer to his problem is simple enough. Find the frequency by stepping through the likely possibilities. The only difficulty here is that according to his scanner they appear to be at or near 484.2125 which seems unlikely to be licensed – but from what he tells us in his later message it seems that the “Sanctuary” isn’t bothered with details like being licensed. Since Mr Coyne doesn’t have a ham license and his IP address is through Windstream, there is no way to tell where he might be located (which would help in guessing the likely frequency). His best bet might be to take advantage of the F-11’s glacially slow scan rate to do a scan at a 6.25 Step, starting from 484.99375 and scanning downward to try to find their frequency. (Even though the sanctuary is operating illegally, the radios are probably programmed on a valid channel).
>
> Once he finds the correct frequency, he will be able to receive their radios even without knowing the CTCSS tone or DCS code. He can then use the radio’s ability to scan for CTCSS tones and DCS codes to determine what tone or code they are using.

Hi Alan,

It sounds to me like the [MONI] button on the left side of the radio or the one of the top row keys of the keypad (excluding the [MENU] key) are stuck.

Attachments: 1 described; binary payloads are missing from this source WARC

OK, that’s a possibility – although there is a reason that the military short-range antenna for the AN/PRC-25 and later AN/PRC-77 was just a whip and not a more complicated design that is sensitive to dimensions and spacing.

One design, that I found works for go bag applications is just a basic 1/4 wave VHF whip (which, of course, also works well as a 3/4 wave at UHF), the trick is to also have a mounting that allows the whip to be mounted on a pole or hung from an overhead support while providing a ground plane when the antenna is elevated. For my own use, after a while I settled on a less complex system that uses three different antennas depending on the specific need.

Three different antennas might sound more complex but it is really very simple:
1. A good rubber duck that is normally on the HT
2. A mobile antenna mounted on each vehicle (and a basic mag mount I keep in case I need to use someone else’s vehicle or a rental)
3. A simple dual band ground plane (a slightly tweaked Radio Shack 20-176) which easily disassembles into a very compact package.

I have some other alternatives (such as a dual band Slim Jim) in the house in case I feel a need for something other than the basic setup above; but that setup is my EDC (Every Day Carry) solution for EComm preparedness.

From: R Pryor MAEd CETsr

Hello,

I already have the twin lead versions made which work really good , one is on a PVC frame (far enough to prevent detune) and the other is on a pop up ATV flag pole rod.

The tape measure idea is to mimic the PRC 77 styled whip. This will be used for a go-can mounted on a Alice pack frame for portable use. The can can run either a HT or a mobile unit on the go. Those are already built and I am using either the ladder line slime jim version on a fiberglass flex rod as mentioned above or just a car mag mount. I just want to create a different antenna system for it.

The tape measure idea would be to copy the Arrow version antenna with ground plane but make it easily stored and flexible.

To prevent the measure from getting too kinked it will be covered with heat shrink tubing in critical areas (hopefully will work) and utilizing the widest measure I can find.

The Yagi design might make a good directional accessory from the tape measure, but I want a Omni directional pattern for this one too. I realize on the edge sides I will have a null in the radiation pattern but that should be ok for its purpose I will just insure its orientation does not null my signals to a repeater.

I will make both, I could not find any good information on this antenna for dual bands except for the Yagi design. Information was found for the HF versions though.

Anyway something fun to experiment with

He couldn’t mean a GMRS license because they don’t qualify for a GMRS license. I would assume he meant a license under Part 90 – which might or might not require changing the frequency they are using.

Glad you were able to get it working.

When we were thinking it might be a 484.xxxxx MHz frequency, knowing the general location would have let us figure out the approximate frequency (if it were on a legitimate frequency). Now that we see it is on a 462.xxxx MHz frequency the actual frequency might be Part 90 (requiring a license) or Part 95 (requiring a license that they are not eligible to get)

Unfortunately there are a lot of non-commercial operations that are blissfully unaware of things like licensing and rules (and quite a few commercial business equally clueless although I have less sympathy for those).

As you are about to find out, the FCC makes Part 90 licensing much more complicated and more expensive than it ought to be – which only discourages licensing and compliance. Hopefully you and they will persevere.

Back when the sanctuary was using Motorola talkabouts they were probably operating on GMRS (which also requires a license, and which they would not have been able to get a license for even if they wanted one). The Motorola talkabouts are legal on FRS (which would have been legal for the Sanctuary without a license) but only on channels 8-14 (channels 1-7 and 15-22 are GMRS channels on these radios). Depending on the size of the sanctuary and the terrain, FRS might not be adequate. Another license-free alternative would be MURS which offers better performance than FRS although there aren’t many MURS radios available today.

I'd be willing to bet they ARE really metric, You'll find out when you put them in.

Okay, went down to Ace hardware and they had the screws 6-32 is the size they ran 20 cents a piece, bought ten to avoid this problem in the future,

Thanks for the help

Ted,

I know in the past, not for the baofeng, I have been able to get screws by going to a hardware store and getting an employee to help me find the right one. If I can find my gages I'll send you measurements of what my screws are tonight (if someone doesn't beat me to it) so you can try searching by the screw itself.

He might not find out, although I agree with you that they are metric..
Chances are if the new screws are steel, they will simply cyt new
threads in the alumininum.

36745. Fixed, "radio did not respond" error...

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-18 22:36:35 UTC
From: <davidrpm@...>
Topic: 36745 Message: 36745

When trying to use CHIRP to program my new UV-5R I would get the 'radio did not response" error message try as I might. My solution was that even though there was no real manufacturer listed on the amazon listing for the programming cable I bought there was a cable driver available. I noticed that in my system information under USB the cable reported as from Prolific Technology, Inc. a quick google search for them and "Macintosh driver" found exactly what I was looking for. No things work great, Thanks, Google!

I wonder how many hams even have radios that can do STE for it to truly be worth the effort to enable on a repeater channel, because I didn't really notice much benefit in his test audio files either.

Hi

They are indeed metric, I have separated 12 from my misc ISO screws, I have more.

They are stainless steel with lock washers, they are not large pan heads but I have checked and they fit my UV5R fine.

Should anyone need 2 just drop me a line at va3glk@... with your name and address and I will send them out to you for the cost of the postage.

The CHIRP interface to RepeaterBook pulls in the repeater listings based on counties within a state. This probably works for most states. But Virginia is unusual in that it has 40 cities that are listed as independents.

As far as getting in touch with the developers, visit the CHIRP website. The have is a CHIRP user mailing list, a CHIRP developer mailing list and a support system for submitting and tracking feature requests, bug reports, etc. Click "Help | About" within CHIRP for the website address.

Make sure you don't have a defective antenna.

Also, what are you using for a source of power. The 6-cell battery packs with 6 alkaline cells provides too much voltage and causes TX to shut down. You have to remove 1 cell and replace it with a dummy cell (aka shunt). If you are using a li-on battery, what is its voltage? Same thing if you are using a battery eliminator.

Gary,

Re-read the thread. CHIRP loads all of the VA repeaters that are in
counties. It does not load the repeaters that are in the 40 cities that are
considered "independents" because they are not listed in any of the 95
counties..

http://en.wikipedia.org/wiki/List_of_counties_in_Virginia

I don't know. I've never had one stick. Can you tell if one is stuck? You might try pressing it a few times to see if it will return to its unpressed position. Maybe you will have to take the radio apart to check the keypad.

Sure they're metric screws from China, but the same thread exists in the American UTS (Unified Thread Standard) :
UTS 6-32 = M3.5 x 0.6 (3.5mm diam., 0.6mm/thread)

On 11/18/2013 02:15 PM, Doug McClure wrote:

I'd be willing to bet they ARE really metric, You'll find out when you put them in.

A more expedient method would be to use "CRC QD (Quick Dry) Electronic Cleaner" available in a red spray can from almost any auto-parts store, and use the small red plastic tube to direct the spray into the problematic key from the front, while multiply-depressing the key.

One should of course be concerned with the solubility of cheap plastics, but my spot-test on the exterior of the radio body below the "Mon" key, and then direct flooding of the entire keypad, after allowing some time for adequate drying of the very volatile solvent from under the keypad, has not degraded the radio's performance.

But I didn't have any spilled ice-cream in there either.

the odd part is that if you use Repeaterbook.com the data is pulled up properly BUT....via Chirp, nothing shows up, so I assume that it MAY be the interface between Cirp and RB....

If that's the case, then the problem lies elsewhere, as 20131117-chirp on Linux has no problem loading the Virginia 2m repeaters: ...

Gary,

Re-read the thread. CHIRP loads all of the VA repeaters that are in counties. It does not load the repeaters that are in the 40 cities that are considered "independents" because they are not listed in any of the 95 counties..

http://en.wikipedia.org/wiki/List_of_counties_in_Virginia

Thanks for verifying my point, Jim. The problem lies elsewhere than chirp, somewhere in the State of Virginia.

repeaterbook.com displays 113 (2m) and 108 (70cm) repeaters for Virginia without any specific county designation, the same as does chirp. It's a simple matter for a user to edit and consolidate both bands with the repeaters of interest before saving to an image.

Have you drilled-down though all the "independent" cities listed in that state to find which aren't included in the larger state listing? Your link returns a "HTTP Error 503: The requested service is unavailable" at this time for anything on en.wikipedia.org, otherwise I'd do it.

http://www.pettitcompany.com/html/va_cities_and_counties.html#VirginiaCities however lists 41 "Independent" cities: Alexandria, Bedford, Bristol, Buena Vista, Charlottesville, Chesapeake, Clifton Forge, Colonial Heights, Covington, Danville, Emporia, Fairfax, Falls Church, Franklin, Fredericksburg, Galax, Hampton, Harrisonburg, Hopewell, Lexington, Lynchburg, Manassas, Manassas Park, Martinsville, Newport News, Norfolk, Norton, Petersburg, Poquoson, Portsmouth, Radford, Richmond, Roanoke, Salem, South Boston, Staunton, Suffolk, Virginia Beach, Waynesboro, Williamsburg, Winchester

Most of these cities occur in the "Comments" column of both the 2m and 70cm chirp downloads, so I'm not sure what the OP's issue is.

OP: What specific repeaters are missing for you?

Wow, did not want to get everyone so passionate about this subject, yes they probably are metric, but I put them in and they worked, that's the bottom line for me, now I can wear the radio on my belt again, instead of my pocket.

Some ham operators are sticklers for precision, I am not, it worked for me, and probably re threaded the socket, but again, a radio that cost me $50 is not a big deal.

the radio works great and I love it, thats all that matters to me

Either way, Thanks to all for the help, I do agree, we need to get an accurate size for the screws for future reference, for others who the same problem I did.

Thank You

No. I made 2 mistakes. I assumed I needed a RepeaterBook account to use the service and I assumed that the OP was correct in stating that the repeaters in the "independent" cities were not listed.

However, after realizing that I can load the RepeaterBook repeater lists without an account, I did so. I have confirmed that all 4 of the Norfolk 2 meter/70centimeter repeaters (the OP's example) are in fact listed.

Thanks for sticking to your guns and patiently taking the time to straighten me out.

Has anyone done any serious research on this important topic?

For example:

The local hardware store wants 10 cents apiece. Will the clones on Amazon for 8 cents work just as well?

Are the screws plain steel or stainless? If stainless, what grade?

Is there a Mil-Spec number or Rockwell Hardness number for them?

Has anyone tried using brass substitutes? What performance difference did you notice, if any?

And if I do use brass screws, does that void the Part 90 certification?

The replacement screws I bought have a slotted head instead of the stock Phillips head. Which screwdriver on e-bay should I buy to install these?

I'm sure all the answers are on the Miklor site but I'm too lazy to look.

Thanks for the help

Ted KE4TTE

Back in July of 2012, Ray stated that he went to Ace and bought M2.5 screws for the clip. That is the size that is stated on the Miklor.com website, but that was probably gleaned from Ray's post. I got my micrometers out and measured one of my belt clip screws and it is indeed a 2.5MM screw. What the miklor.com http://miklor.com doesn't state is how long they are. Mine are 6MM long.

A #6-32 screw is too large to fit a M2.5 threaded hole. So unless Baofeng changed the size of the threaded hole and screw, or it is different based on one of the various case styles, I would be skeptical of the 6-32 size.

It would be nice to know for sure. I know John would want to update the miklor.com http://miklor.com website accordingly.

Anyone seen this before?

Yes. This has been reported before. But to the best of my recollection, only after Baofeng came out with BFB291 firmware did we begin to hear of this happening.

I would restore from a previously saved image of the radio's channels and see what happens. If that doesn't take care of it, then I would try the "Recover from Erratic Behavior" procedure on the Miklor.com website.

Gary,

A few weeks ago I was in the Delmarva Penninsula portion of Virginia. North of the Bay bridge and tunnel. I successfully loaded (by county) the repeaters in Accomac and Northampton counties. When I tried to load repeaters across the Bay, such as in Norfolk,Virgina Beach, Newport News, I got nothing. These "cities" are listed in the drop down menus for Chirp but I got nada....and I was not able to identify that they were in any county..(I guess because they are not IN a county)

When I went to the web site for RepeaterBook, I was able to see that in fact there were repeaters in those locations....as I assumed. Chirp did not allow me to "selectively" choose those areas and get the repeaters...

Now....it sounds like what you did, was look at downloading ALL of Virgina, and that got you the missing repeaters......I guess that is one way to look at this and sort/select what is wanted.
Not being picky at all, but one would think that the programming logic "ought" to be the same for these "cities" since they do show up in the drop down menu in Chirp.

T

My radio has been doing the same thing a couple time as well, I've decided not to program anything in Channel 0 until I can get my hands on the programming software and cable, doing it by hand isn't too bad after working on it a few times to learn the keypad strokes and all.

Of course it is, but that part of the "UHF Television band" is also available for Part 90 licensing in various places in the US. (See Part 90, Subpart L, Section 90.303 and Section 90.311)

484.21250 is a valid, licensable, Part 90 frequency in Boston, MA; Dallas/Fort Worth, TX; Detroit, MI; and San Francisco/Oakland, CA. It is also licensable for Safety Pool eligibles in Los Angeles, CA.

I am a bit pressed for time otherwise I would go through the archives.

Which model should I purchase of the baofeng_uv5r (or its improvements)? I know some had found a very superior antenna and I need to know which one. What other accessories am I likely to want right away?

Thank you!

This issue was unheard of for firmware versions older than BFB291. There must be a secret 'handshake" that causes channel 0 to be reset but nobody has figured out what it is.

Obviously not. But the metric and SAE are not the same. The diameters are different and the pitch is also different, almost in between each other. You can get one to fit the other if you only do a turn or two, then it will bind and you can mess up the threads, the softer metal being rethreaded more than the other. If the screw is undersized you get away with more turns before damage. But if that's what some one wants to do, let them. Their radio.

Subject: RE: Re: [baofeng_uv5r] RE: RE: RE: Screws for belt clip for UV 5R

Has anyone done any serious research on this important topic?

For example:

The local hardware store wants 10 cents apiece. Will the clones on Amazon for 8 cents work just as well?

Are the screws plain steel or stainless? If stainless, what grade?
< /p>

Is there a Mil-Spec number or Rockwell Hardness number for them?

Has anyone tried using brass substitutes? What performance difference did you notice, if any?

And if I do use brass screws, does that void the Part 90 certification?

The replacement screws I bought have a slotted head instead of the stock Phillips head. Which screwdriver on e-bay should I buy to install these?

I'm sure all the answers are on the Miklor site but I'm too lazy to look.

Ted KE4TTE

Back in July of 2012, Ray stated that he went to Ace and bought M2.5 screws for the clip. That is the size that is stated on the Miklor.com website, but that was probably gleaned from Ray's post. I got my micrometers out and measured one of my belt clip screws and it is indeed a 2.5MM screw. What the miklor.com http://miklor.com doesn't state is how long they are. Mine are 6MM long.

A #6-32 screw is too large to fit a M2.5 threaded hole. So unless Baofeng changed the size of the threaded hole and screw, or it is different based on one of the various case styles, I would be skeptical of the 6-32 size.

It would be nice to know for sure. I know John would want to update the miklor.com http://miklor.com website accordingly.

Team,

I'm working on a new update to the Chirp LiveCD and need some information please.

Could I get a user of an RT Systems cable to boot into Linux (the Chirp LiveCD would work great) and gather some information for me please.

Once the Chirp LiveCD boots, close Chirp and another open windows.
Plug in your RT Systems cable
Right-click on the desktop then select 'Open Terminal Here'
Type the following then press enter: dmesg >> RTdmesg.txt
Then type the following and press enter: lsusb >> RTlsusb.txt
Close the terminal window
There should now be two new files on the desktop, RTdmesg.txt and RTlsusb.txt.
Please post those two files on the forum for me. You should be able to go online right from the Chirp LiveCD. If you use wifi, you may have to click on the arrow icon at the top of the screen and connect.

Thanks in advance.

Bob

I would agree on those 4 as the basics (although some people might find a second 1800 mAH battery a more convenient choice rather than the 3800 mAH battery)

Depending on the intended uses, some likely choices for the next tier might be:
Dry Cell Holder (AA or AAA size) (or both) - for EComm or emergency preparedness
Speaker Mic - for base or in car use
SMA-F to SO239 or BNC-F pigtail – for connection to a base or mobile antenna
TYT Battery Charger – superior to the BaoFeng charger base
Dual Band Slim Jim antenna – for portable use or as an indoor base antenna (also usable as an outdoor base antenna but I'd suggest a rigid all metal J-pole or discone antenna for long-term outdoor use)

Below are links to examples of each item.

And if you don't want to spring the $$ for an extra antenna that performs better buy your radio from threeoldcrows:

http://threeoldcrows.com/shop/magento/

Kurt puts the "better" Baofeng antenna on his radios. I don't know any other supplier that guarantees that.

You lose about 3dB sticking with the A-V85 Baofeng antenna on VHF but there's a big difference on UHF – around 9dB loss compared to the RH771. But if you're just starting out you may only use VHF repeaters so won't lose a whole lot.

It's also surprising to find how many very experienced operators tend to sneer at them simply because they're made in China, without spending as much as they might on any given bar visit to find out for themselves.

36825. Baofeng UV-5R+/Chirp Radio Error - Problem Solved - New Cable

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-21 01:52:20 UTC
From: <texasflyboy@...>
Topic: 36825 Message: 36825

I had the "Radio not responding" error when using Chirp to program my Baofeng UV5R+. The cable that I purchased on Amazon used a Prolific chip. I checked the cable with the Prolific check tool and it said the cable was ok. But, after two weeks of the cable working ok, all of a sudden I was unable to download or upload using Chirp. The radio was unresponsive. I was using the 3.2.2 Prolific driver.

My solution was to purchase a Kenwood USB KPG-22 Cable using the FTDI chipset. As soon as I plugged in the Kenwood cable Windows loaded the USB drivers and I was able to connect to the UV-5R+ using Chirp 20131118 on 11/21/2013.

My setup is:
Dell Desktop PC Inspiron 600 Series
OS: Windows 7 Professional 64 Bit
Kenwood USB KPG-22 FTDI Interface Cable (Purchased from Valley Enterprises)

FYI for the Archives

Keywords: Baofeng UV-5R+, UV5R, Prolific, Baofeng Not Connection, Baofeng CHIRP problems

I use only the BaoFeng software (normally VIP, but I have used their basic software once or twice)

Of my two UV-5R radios, ONE had channel 0 revert to default ONCE. I reloaded the frequencies and have never had any trouble since then.

Subject: Re: [baofeng_uv5r] RE: Channel 0 gone and I didn't do it.

Just out of curiosity, how many of you with the Channel 0 issues are using Chirp and how many are using Baofeng's VIP software? I ask only because none of the many units I've programmed with VIP seem to have this issue, but I could just be lucky.....

up?

I would agree on those 4 as the
basics (although some people might find a second
1800 mAH battery a more convenient choice rather
than the 3800 mAH battery)

Depending on the intended uses,
some likely choices for the next tier might be:
Dry Cell Holder (AA or AAA size)
(or both) - for EComm or emergency preparedness
Speaker Mic - for base or in car
use
SMA-F to SO239 or BNC-F pigtail
– for connection to a base or mobile antenna
TYT Battery Charger – superior
to the BaoFeng charger base
Dual Band Slim Jim antenna – for
portable use or as an indoor base antenna (also
usable as an outdoor base antenna but I'd
suggest a rigid all metal J-pole or discone
antenna for long-term outdoor use)

Below are links to examples of
each item.

Aaron,

Depending on where you live, you might very well have an EchoLink or IRLP repeater near you (you can google a list). If so, you may want to add them to your list of repeaters to monitor until you get your license, as both systems (EchoLink and IRLP) are capable of having hams check in from all over the world.

I routinely work friends around the country on IRLP using my local node, especially when getting on the low bands (HF) just isn't as convenient (like when I'm working late).

Just a suggestion.

Craig

The most common issue is not running the proper drivers when using a generic programming cable.
If you are running Vista, Win7 or Win8, your driver Cannot be newer than Prolific 3.2.0.0
This driver is found in the DRIVERS and USB Cables section.
If the wrong driver is installed, it will not work.
Refer to http://www.miklor.com/COM/UV_Drivers.php

Both CHIRP and the factory software are good, but I personally lean toward CHIRP
http://www.miklor.com/UV5R/

Enjoy your new toy.

John K3NXU http://www.miklor.com

If you haven't already, you may want to review the USER's GUIDE and FAQ found at
http://www.miklor.com/UV5R
Driver - http://www.miklor.com/COM/UV_Drivers.php
and Software information can also be found there.

They will save you a lot of time and frustration.

PTT ID ANI and Alarm are numerical ID that you can program, ditto ANI and alarm code.

On the memory side these are controlled by menus 15-17 & 19. 17 determines which of the 15 identifiers (if any) to use. 19 determines whether it will squirt an ID at the beginning of transmission (pushing PTT), end of transmission (release PTT) or both. If you set this properly whatever is put in those fields will be squirted out as a DTMF.

DTMF speed (on) is the length of each DTMF numeral in milliseconds.
DTMF speed (off) is the spacing between each DTMF numeral, also in milliseconds.

I don't know if they still do this or if they've switched up, but this was the way Dade County (Florida) law enforcement used to ID their radios.

---In baofeng_uv5r@yahoogroups.com, <erik6584@...> wrote:

G'Day,

Thought I'd try and compile as best I can all the CHIRP settings available for the Baofeng UV-5R+ and what each of them do and how they affect your radio.

Some of these I will need help figuring out what they do, but here goes:

Basic Settings:

Carrier Squelch - can be set 1-9, defines how strong a signal has to be before it is picked up by the receiver.
Battery Saver - unsure of this one - seems to delay the receiver activating on reception of a signal, not sure why. Need more information.
Backlight Timeout - might have something to do with the setting of 'Standby LED Color'. Need more information.
Beep - Keypad beep, you can either enable or disable.
Timeout timer - Times out a transmission after a set length of time to prevent channel hogging. Also useful to avoid overheating the LCD display and/or final transmitter transistors.
Display Mode (A) - Used in MR mode, has the following settings:
* Channel (shows the current memory number for the frequency you have selected)
* Name (the name you set for the frequency you have selected)
* Frequency (self explanatory - shows the frequency in the memory you have selected.
Standby LED Color: can be set to either Blue, Orange or Purple or just turned off.
RX LED Color: this is a back light colour, illuminates when you are receiving messages. Can be set to Blue, Orange or Purple or turned off.
TX LED Color: same as RX LED Color except illuminates when transmitting.
Roger Beep - transmits a short 'beep' when you release the PTT button so the other channel users know you've finished transmitting. Can be enabled or disabled.

Advanced Settings:

VOX Sensitivity - used when you want to speak into the radio without pushing PTT. Can be set from 1-10. 0 turns it off.
Dual Watch: Watches two different frequencies/memories at once and listens for activity on either one.
Dual Watch Priority: Three settings, Off, A and B. if set to either A or B, that display's frequency or memory shown will be scanned for activity more frequently than the other display.
Alarm Mode: Three settings. Site, Tone, Code. Site is for alarm testing and does not transmit alarm over the air. Need more information.
Voice: The voice you hear when you operate the radio manually. Can be set to English, Chinese or turned off.
Scan Resume: Has three settings: TO, CO and SE. Need more information.
Busy Channel Lockout: Stops you transmitting on a channel that is receiving a signal. Can be set either enabled or disabled.
Automatic Key Lock: Can be set either enabled or disabled. Need more information.
Broadcast FM radio: Can enable or disable reception of the broadcast FM band.
Squelch Tail Eliminate (HT to HT): Can be enabled or disabled. Need more information.
Squelch Tail Eliminate (repeater): Can be set from 1 to 10 or turned off. Default is 5. Need more information.
STE Repeater Delay: Default is off, can be set from 100ms to 1000ms (0.1 to 1 sec). Need more information.
RESET Menu: Enables Menu 40, can be enabled or disabled.
All Menus: can be enabled or disabled. Need more information.
VFO/MR button (F-11 only): Redundant, not needed for UV-5R+.

Other Settings:

Firmware Message 1: Shows firmware version.
Firmware Message 2: Shows firmware version.
6+Power on Message 1/2: Need more information.
Power-On Message 1: Welcome Message Line 1.
Power-On Message 2: Welcome Message Line 2.
Power-On Message: Can be set to 'Full' or 'Message.' Need more information.
VHF Lower Limit (MHz): Cannot be set below 136.
VHF Upper Limit (MHz): Cannot be set above 174.
Limits the frequencies that can be manually entered and stored by user.
VHF TX Enabled: can be enabled or disabled. Possibly redundant, need more information.
UHF Lower Limit (MHz): Cannot be set below 400.
UHF Upper Limit (MHz): Cannot be set above 512.
UHF TX Enabled: can be enabled or disabled. Possibly redundant, need more information.

Work Mode Settings:

Display: Can be set to either A or B. Need more information.
VFO/MR Mode: Can be set to either Frequency or Channel. Apparently sets the radio mode on boot up.
Keypad Lock: Can be enabled or disabled. Need more information.
MR A channel: Displays the memory channel for the 'A' display upon boot up, selectable from 0-127. Any channels not programmed apparently have a default frequency. Need more information.
MR B channel: Same as MR A channel except using the 'B' display.
VFO A Frequency: Default frequency to be displayed on 'A' display.

VFO B Frequency: Same as VFO A Frequency except using the 'B' display.
VFO A Shift: Can be set to either Off, + (positive) or - (negative) offset.
VFO B Shift: Same as VFO A Shift.
VFO A Offset: If set, will offset the entered VFO freq positive or negatively with the chosen offset (range is 0.00 to 69.95).
VFO B Offset: Same as VFO A offset.
VFO A Power: Can be set High or Low. Controls which power modes are set upon switching displays with the A/B button.
VFO B Power: See VFO A Power.
VFO A Bandwidth: Can be set either Narrow or Wide for either display.
VFO B Bandwidth: Same as VFO A Bandwidth.
VFO A PTT-ID: Need more information, can be set from 1 to 15.
VFO B PTT-ID: See VFO A PTT-ID.
VFO A Tuning Step: When either the A or B display is selected, using the up/down arrow keys in VFO mode will make the frequency step up or down the kHz setting here. Can be set from 2.5kHz to 50kHz.
VFO B Tuning Step: See VFO A Tuning Step.

DTMF Settings:

Need more information on pretty much all of the following:
PTT ID Code 1-15
ANI Code
ANI ID
Alarm Code
DTMF Sidetone
DTMF Speed (on)
DTMF Speed (off)

Thanks,

Erik

I'll add to this that often when you install the driver from Miklor, Windows will update the driver after a bit and you'll run into the same issue. Go to Device Manager and revert the driver back to 3.2.0.0 and it won't update again. At least not until M$ once again updates the driver, then rinse and repeat.

---In baofeng_uv5r@yahoogroups.com, <mooneyjockey@...> wrote:

Hi,

Your problem isn’t the software, either the CHIRP or the VIP software form BaoFeng will work well for programming your radio. The issue you are having is that of the cloned prolific chip in your ‘BaoFeng’ branded programming cable and the software driver loading on your Windows 7 PC. The following is a response I wrote a couple months ago regarding the cloned Prolific chips and software drivers, especially relating to Windows 7 & 8 operating systems on PC’s.

There are some real misconceptions about Chirp and drivers and Windows 7 and 8 operating systems floating around out here.

First of all CHIRP will run on Windows XP / Vista / 7 / 8 operating systems as well as MAC and Linux systems as well.

Drivers have nothing at all to do with CHIRP or the operating system, but they work with the UART (Universal Asynchronous Receiver/Transmitter) chip in the programming cable. The UART chip is the interface module that converts the USB signal to a standard Serial Communication signal to be sent to the radio.

If you have a programming cable with a GENUINE Prolific UART module chip, an FTDI UART module or a Silicon Labs CP-2102 UART module, you will not have any issues using Windows 7 or Windows 8 to program your radio using CHIRP or any other available software for that matter. IF you have an imported programming cable with a PIRATED, CLONED or COUNTERFEIT (fake) serial UART chip you will most assuredly encounter problems when attempting to use Windows 7 or Windows 8.

Prolific, the manufacturer of the Prolific UART chip updated the driver software for their chips in late 2011 due to the illegal counterfeiting of their patented technology. The new drivers have the ability to determine if the chip is a genuine Prolific chip or an illegal counterfeit product, and will not function with the illegal chip. This prevents all of the driver software released after approximately Jan 2012 from working correctly with the imported cloned chips.

Now if you are very careful and follow the instructions on the Miklor.com web site and correctly install the old, pre 2102 , driver you can get everything to work, but beware, you will have problems in the future…

The reason you will encounter these problems stems from the simple fact that Microsoft, in all of their great wisdom, decided some time ago that they knew better that the owner of a computer when and what needed to be updated in the operating system. Every time you re-start your computer or connect a USB programming cable to a Windows 7 or Windows 8 computer, the operating system will load the latest and greatest driver software available for the device identified. So what happens is that your cloned prolific USB Serial UART programming tells your computer that it is a Prolific PL-2303 and Windows grabs and loads the new Prolific Serial UART driver and BANG your computer cannot communicate with your radio anymore.

You can possibly prevent this problem by turning of Automatic Updates, but the surest method of eliminating the problem is to us a programming cable with a legitimate version of a reputable manufacturers Serial UART chip.

FYI, this is a excerpt copied directly from the Prolific website
http://www.prolific.com.tw/US/ShowProduct.aspx?p_id=225&pcid=41
http://www.prolific.com.tw/US/ShowProduct.aspx?p_id=225&pcid=41 for your information only:
Warning Notice:
Please be warned that counterfeit (fake) PL-2303HX (Chip Rev A) USB to Serial Controller ICs using Prolific's trademark logo, brand name, and device drivers, were being sold in the China market. Counterfeit IC products show exactly the same outside chip markings but generally are of poor quality and causes Windows driver compatibility issues (Yellow Mark Error Code 10 in Device Manager). We issue this warning to all our customers and consumers to avoid confusion and false purchase.

Please be warned that selling counterfeit products are illegal and punishable by civil and criminal courts according to the trademark, copyright, and intellectual properties laws and regulations. Prolific will take proper and severe actions to cease and confiscate these counterfeit products. Prolific also prohibits the distribution of any PL-2303 drivers (including download links) without written permission from Prolific.

Prolific advices end-users to only purchase vendor branded cable products with company name contact information for service and support. Prolific does not sell cables with Prolific brand and packaging. In case you suspect a counterfeit chip inside, you may also contact Prolific to provide the vendor information.

Subject: [baofeng_uv5r] Programming UV5R with USB cable from Baofeng

I have purchased a USB cable from Baofeng and tried to use CHIRP to program my UV5R. No luck. I run WIndows 7. I have read about bad USB cables on-line. What is the best software to use...Chirp or the software from Baofeng? I would really like to use the computer to program the radio. Thanks for any assistance.

Personally I don't believe the figures anyone lists for an antenna, or radio. I only believe what works for me. And what works for me may, or may not, work for you!

Subject: RE: [baofeng_uv5r] RE: What should I purchase for a complete set up?

  I just ran the TRAM 1185 through my antenna analyzer.

At 154 MHz SWR is 1.5
At 155 MHz SWR is 1.6
At 455 MHz SWR is 1.2
At 465 MHz SWR is 1.8

And…
At 140MHz is 1.5
Minimum SWR is 1.4 at 143MHz on VHF

You can’t believe the ranges they put on these things.

Subject: Re: [baofeng_uv5r] RE: What should I purchase for a complete set up?

The biggest difference between the TRAM 1181 and 1185 is that the 1181 supports the VHF band from 140-170 Mhz and UHF band from 430-470 Mhz. The 1185 only supports 144-148 Mhz for VHF and 435-450 Mhz.

I think the 1181 was designed for Public Safety.

I’m a volunteer fire fighter/ rescue in my county and operates on 154 to 155 VHF and 455 to 465 UHF.

Im also working on my Amateur Technician License.

Im looking for a mobile antenna that I can use for both Public Safety and Ham use.

Subject: RE: [baofeng_uv5r] RE: What should I purchase for a complete set up?

Since it appears the 1181 is just the 1185 with an NMO mount instead of the mag mount I'd expect it to perform the same as the 1185 in my test.
And the 1185 did the best of the mobile mag mounts I had on VHF but was one of the worst on UHF.

Don’t consider the bandwidth listed by any antenna company as gospel. A few antenna companies will provide Frequency/SWR charts for their antennas and a few others will at least mention how they determined the bandwidth that they are claiming – but most just give some numbers with no details to back up those numbers.

Also many companies will list different “usable” frequency ranges depending on where they are advertising the antenna. When an antenna is advertised to ham radio operators, the company is likely to emphasize its coverage of the ham bands, but if they advertise that same antenna in a publication for public safety users they are likely to emphasize the frequency range somewhat above the ham bands.

How can the same antenna have different usable frequency ranges? Sometimes the answer is that those are just advertising numbers. Most of the time the answer is that the show the same antenna when it is tuned differently. Most antennas can be tuned to be resonant at some frequency, then that antenna is “usable” over some range above and below that resonant frequency – how far above and below the resonant frequency is often a matter of opinion. Generally speaking, the further you get away from the resonant frequency the greater the SWR will be. Often the frequency range listed for an antenna is based on frequency span over which the antenna will deliver and SWR of no more than 3:1 – some antenna companies will claim a very wide range by counting the entire span across which the antenna could be tuned to provide an SWR no worse than 3:1 even though in actual use it is only usable over a fraction of that span. Unless the company gives detailed data about how the numbers were determined they are just numbers.

Nearly all modern solid-state radios include circuitry that will automatically sense an SWR mismatch and will reduce the radio’s power output if it senses too high an SWR. This will protect the radio from having the final amplifier circuitry burned out by transmitting into a moderately high SWR. Some radios start reducing the power output at an SWR that most users would otherwise consider acceptable – nearly all modern radios will significantly reduce power output by the time the SWR is 2:1 and will have very little (if any) output by the time the SWR is 3:1.

> I’m a volunteer fire fighter/ rescue in my county
> and operates on 154 to 155 VHF and 455 to 465 UHF.
> Im also working on my Amateur Technician License.
> Im looking for a mobile antenna that I can use for
> both Public Safety and Ham use.

It is very hard to get wide bandwidth AND dual band performance. Most dual-band antennas rely on the approximately 3x relationship between the VHF and UHF bands – most antenna

designs resonant at a VHF frequency are also resonant at the UHF frequency that it three times the VHF resonant point. So an antenna tuned to be resonant at 146.000 MHz is likely to also be resonant at 438.000 MHz (146x3=438). For hams, the 70cm band is just a little higher than 3 times the 2m band, so this works reasonably well. For Public Safety users the bands are a better 3x match, but the overall width of each band makes a good match difficult unless the frequencies themselves are just right. Public Safety users rarely need both VHF and UHF and until recently almost never had both in one radio, so Public Safety users have generally used separate VHF and UHF antennas each tuned to the proper frequency or to the middle of the range needed.

Generally speaking, the more “gain” any omnidirectional antenna has, the narrower its usable bandwidth. So if you need an antenna the works over a wide frequency range without retuning the antenna, you should usually be looking at a simple design with little or no “gain” – for a mobile antenna, the best real-world performance over over the ham + public safety frequency range is probably a simple VHF quarter-wave cut to be resonant just above the top of the 2 meter ham band. A 1/4-wave whip antenna resonant between 149-150 MHz will provide reasonable performance across the 144-155 MHz range with most radios. That same antenna will be usable on the ham 70cm band, and it will receive quite well on UHF public safety frequencies but may not transmit well much above 460 MHz.

There are some really broadband antenna designs (such as the discone) but they are more complex and rarely practical as a mobile antenna.

There are also some “dual band” antennas that can be tuned separately for the VHF and UHF frequencies, but these tend to provide relatively narrow bandwidth on each band.

Hello all,
I just got my UV-5RA yesterday, it's very different from my old HT, Kenwood TH-78A, aside from no squelch knob, I love it so far.

I see there are two choices for 12v car power, looks like a cigarette lighter adapter for the charging stand, and a battery eliminator. Is there a battery where you can plug a cigarette lighter adapter directly into the battery for power & charging?

Not having a car charger that plugs into the radio or battery itself seems a little strange to me.

Thanks!

There is a TYT battery that fits the UV-5R series of radios that has a charging port. However, I have never seen the 12v auto charger sold separate from the radio.

Now that you have a Chinese radio, eventually you will get used to strange and it will become your new normal. ;-)

But the power adapter has to be 8.4V with the charging smarts of the charging cradle. Like I said previously, the only such charger I've seen is the one the comes with the TYT UV-F9 and I have been unable to locate it separately. Anything else and you stand a chance of ruining the battery.

Without the proper charger, the port is only useful for providing power to some other external device that can run from 7.4v.

Well Scott, yes... and no.
Actually, there is, the 3800mAH guy. But, the jack is connected directly to the battery so you will need a cigarette lighter plug with the smarts to SAFELY charge the battery while you're using it. Don't know that one is available. Check with Kurt at Three Old Crows Trading Company... he's up on all this stuff.
Also, the Battery University warns against running the radio at the same time you're charging it. Has to do with the charger becoming confused and over charging the battery.

The radio's main use is commercial. Having an in car charging setup in not a high desirability item there.

Stan

Yes, those are the options. Although there really are three options and you have to be careful choosing among them. (See below)

> Is there a battery where you can plug a cigarette lighter
> adapter directly into the battery for power & charging?

Nope.

> Not having a car charger that plugs into the radio or
> battery itself seems a little strange to me.

Not the least bit unusual for a radio using Lithium Ion battery chemistry. Li-ion batteries require a fairly intelligent charger that senses both current flow and voltage and regulates both. You can't just dump a selected voltage into the battery like you could in the old days of NiCd batteries.

As you noted the choices for automotive power are between a "battery eliminator" and a cigarette lighter plug feeding the charger base.

The battery eliminator is pretty straightforward (although some of them do encounter problems of overheating)

For the cigarette lighter style there are really two very different choices.

You can get a cigarette lighter plug adapter that regulates the voltage down to about 10vDC - which can then plug into the regular BaoFeng charger base.
http://threeoldcrows.com/shop/magento/ham-radio-equipment/accessories/12-24-volt-car-charger-cable-for-bapofeng-radios-10v-500ma-output.html

Or you can get the more common cigarette lighter plug adapter that has the right plug on the end but doesn't have any voltage regulating circuitry inside. These adapters will deliver the full automotive voltage (12-14vDC) directly to the plug, and thus directly to the charger base. If you connect one of these to the BaoFeng charger base it will rapidly overheat at 12v (car not running) and will simply stop working at about 13.5v or higher (car running). You can use one of these adapters (or simply direct wire from the car electrical system to the charger base) ONLY if you use the TYT charger base instead of the BaoFeng charger base. The TYT charger and BaoFeng charger are interchangeable except that the TYT charger has much better construction and provides adequate regulation to operate safely up to about 14vDC input.

The simpler and more reliable alternative for most people is to simply use the radio battery while in a car -- unless you are vacationing in a motorhome or are an over-the-road truck driver spending several days straight behind the wheel.

I would generally advise against using a solid adapter to connect normal coax cable (RG-58, RG-8X, RG-8, etc) to the antenna connector on the radio.

Even the most flexible RG-58 is still stiff enough that each movement of the radio will put a bit of strain on the antenna connector of the radio. There isn't really any support for the connector besides where it is soldered to the board so it is best to avoid stressing the connector any more than necessary.

That is why many of us recommend using a pigtail style adapter constructed with RG316 or RG174 coax. Either of these thin coax cables is much more flexible than the more common RG-58. The thin coax does have more loss than good RG-58, so you don't want to try to run thin coax all the way from the radio to an antenna, but 2-3 feet provides good flexibility without incurring noteworthy loss.

Great way to destroy (and quite possibly blow up) a battery!

Yes, most of the 3800 mAH batteries for the BaoFeng radios do have a barrel jack on the battery -- but that jack is wired directly in parallel with the charger contacts at the bottom of the battery and with the radio contacts on the top of the battery. THERE IS NO CHARGE REGULATING CIRCUITRY ANYWHERE IN THE BATTERY! If you apply 12v (or OMG 13.8v) to that plug you will burn up the battery (and very possibly cause it to blow up and/or catch on fire).

I suppose someone could cannibalize a charger base (preferably the TYT base) or scratch build a Li-Ion charging regulator to plug into that jack; but there is no way to safely connect automotive electrical voltage directly to that jack, and I have yet to see a regulated charger designed to connect to that jack.

back in sepember's issue of Popular Communications Magazine, Bill Price, the author of PopComm's feature, "The Loose Connection", discussed his experiences with what i suspect was a uv5r after receiving one a few months earlier. his approval of the unit may have added some credibility for the little HT we like so much.

I remember seeing a Radio Shack car charger a while back that had both interchangeable tips, the ability for either positive or negative on the center pin, AND the ability to alter the voltage from 12v all the way down to 1.5 volts (with many in between voltage steps available).

I don't believe it had any internal smart circuitry in it to automatically prevent over-charging, but "if" (and of course that's a BIG if) you had one and closely monitored your charging time with an almost dead extended battery, I think you could get away with using it if necessary.

I might still have one, and if I can find it, I'll try testing it out to see how well (or how poorly) it works with the extended battery on one of my units the next time I need to charge it.

It really depends on why one would buy it. I got the the solid SMA to BNC adapter that fits flush to the radio (I'll try to take picture later). Which uses the case for part of the stress relief like most of the SMA antenna's do.

The reason for getting it, I'm constantly switching antenna for use. Reading up on SMA, they don't hold up to connecting and removing the connectors as well as some others do. Considering I'm changing antennas several times a day, I wanted something that will last. BNC was designed to be connected and pulled regularly.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

I would generally advise against using a solid adapter to connect normal coax cable (RG-58, RG-8X, RG-8, etc) to the antenna connector on the radio.

Even the most flexible RG-58 is still stiff enough that each movement of the radio will put a bit of strain on the antenna connector of the radio. There isn’t really any support for the connector besides where it is soldered to the board so it is best to avoid stressing the connector any more than necessary.

That is why many of us recommend using a pigtail style adapter constructed with RG316 or RG174 coax. Either of these thin coax cables is much more flexible than the more common RG-58. The thin coax does have more loss than good RG-58, so you don’t want to try to run thin coax all the way from the radio to an antenna, but 2-3 feet provides good flexibility without incurring noteworthy loss.

Yes, if you are going to use a solid adapter at the radio, it is much better to use one with a wide base that fits flush with the radio (or add a rubber washer to make it flush) so that the case carries most of the stress.

Using an SMA-F to BNC adapter to avoid frequently screwing/unscrewing the SMA connector is a good idea, but 1) it ought to be the wider base type as rattis recommends, AND 2) the coax connected to it ought to be RG316 or RG174, not RG58 or any of the stiff varieties of coax cable.

You have to remember that the target market for this radio is not an
experimenter that will be using the radio with an external antenna or
trying out a plethora of "rubber duckies".

Subject: RE: [baofeng_uv5r] Programming UV5R with USB cable from Baofeng

Hi,

Your problem isn’t the software, either the CHIRP or the VIP software form BaoFeng will work well for programming your radio. The issue you are having is that of the cloned prolific chip in your ‘BaoFeng’ branded programming cable and the software driver loading on your Windows 7 PC. The following is a response I wrote a couple months ago regarding the cloned Prolific chips and software drivers, especially relating to Windows 7 & 8 operating systems on PC’s.

There are some real misconceptions about Chirp and drivers and Windows 7 and 8 operating systems floating around out here.

First of all CHIRP will run on Windows XP / Vista / 7 / 8 operating systems as well as MAC and Linux systems as well.

Drivers have nothing at all to do with CHIRP or the operating system, but they work with the UART (Universal Asynchronous Receiver/Transmitter) chip in the programming cable. The UART chip is the interface module that converts the USB signal to a standard Serial Communication signal to be sent to the radio.

If you have a programming cable with a GENUINE Prolific UART module chip, an FTDI UART module or a Silicon Labs CP-2102 UART module, you will not have any issues using Windows 7 or Windows 8 to program your radio using CHIRP or any other available software for that matter. IF you have an imported programming cable with a PIRATED, CLONED or COUNTERFEIT (fake) serial UART chip you will most assuredly encounter problems when attempting to use Windows 7 or Windows 8.

Prolific, the manufacturer of the Prolific UART chip updated the driver software for their chips in late 2011 due to the illegal counterfeiting of their patented technology. The new drivers have the ability to determine if the chip is a genuine Prolific chip or an illegal counterfeit product, and will not function with the illegal chip. This prevents all of the driver software released after approximately Jan 2012 from working correctly with the imported cloned chips.

Now if you are very careful and follow the instructions on the Miklor.com web site and correctly install the old, pre 2102 , driver you can get everything to work, but beware, you will have problems in the future…

The reason you will encounter these problems stems from the simple fact that Microsoft, in all of their great wisdom, decided some time ago that they knew better that the owner of a computer when and what needed to be updated in the operating system. Every time you re-start your computer or connect a USB programming cable to a Windows 7 or Windows 8 computer, the operating system will load the latest and greatest driver software available for the device identified. So what happens is that your cloned prolific USB Serial UART programming tells your computer that it is a Prolific PL-2303 and Windows grabs and loads the new Prolific Serial UART driver and BANG your computer cannot communicate with your radio anymore.

You can possibly prevent this problem by turning of Automatic Updates, but the surest method of eliminating the problem is to us a programming cable with a legitimate version of a reputable manufacturers Serial UART chip.

FYI, this is a excerpt copied directly from the Prolific website
http://www.prolific.com.tw/US/ShowProduct.aspx?p_id=225&pcid=41
http://www.prolific.com.tw/US/ShowProduct.aspx?p_id=225&pcid=41 for your information only:
Warning Notice:
Please be warned that counterfeit (fake) PL-2303HX (Chip Rev A) USB to Serial Controller ICs using Prolific's trademark logo, brand name, and device drivers, were being sold in the China market. Counterfeit IC products show exactly the same outside chip markings but generally are of poor quality and causes Windows driver compatibility issues (Yellow Mark Error Code 10 in Device Manager). We issue this warning to all our customers and consumers to avoid confusion and false purchase.

Please be warned that selling counterfeit products are illegal and punishable by civil and criminal courts according to the trademark, copyright, and intellectual properties laws and regulations. Prolific will take proper and severe actions to cease and confiscate these counterfeit products. Prolific also prohibits the distribution of any PL-2303 drivers (including download links) without written permission from Prolific.

Prolific advices end-users to only purchase vendor branded cable products with company name contact information for service and support. Prolific does not sell cables with Prolific brand and packaging. In case you suspect a counterfeit chip inside, you may also contact Prolific to provide the vendor information.

THAT is a matter of highly personal opinion. Unless you have additional different radios to program, there is no clear advantage to CHIRP over the BaoFeng VIP software – and at least the BaoFeng software is reasonably obvious for new users who don’t need to guess which two or three columns need to interact to make a single setting work as expected.

Gonna take the test on Dec 14. I passed my Novice test 47 years ago when I was nine so I am hopeful of a positive outcome. ;-)

I have to agree with Xuan on this one. Chirp is very useful if you have multiple brands of different radios that you wish to program with the same memory scheme *and* every one of those different radios is supported by Chirp - but many of those radios only seem supported via daily builds, plus many of the columns all have to work as "one" in order to get some functions to work correctly on the radio.

I've probably programmed over 500 Baofeng radios to date, and countless more have been re-programmed by request, and I don't believe any of those radios have encountered the mysterious "memory 0" issue either (of course I've probably just guaranteed that several will fail this weekend with memory 0 issues).

Not knocking Chirp, or those that prefer the RT Systems choice either, just saying that VIP isn't a bad choice for those wanting to program their radios via the computer and cable, they all have their pros and cons.

Visit the Miklor.com website. On the UV-5R home page look for "Menu
Detailed Reference". The links will get you access to the "Reference for
UV-5R Menus". It will help you learn about your radio's menus.

While you are there, look at the Users Manual page. There are manuals there
that are better than the manual that comes with the radio.

Not sure where you got that idea from…

See http://www.miklor.com/uv5r/UV5R-FAQ.php/#certify
http://www.miklor.com/uv5r/UV5R-FAQ.php/#certify

Either licensed Part 90 or Ham license. Either way it’s licensed.

If you want a hiking radio to use without a license you need to get one of the FRS radios.
http://www.walmart.com/ip/GMRS-FRS-2-Way-Radio/22238140
http://www.walmart.com/ip/GMRS-FRS-2-Way-Radio/22238140
Even the GMRS/FRS radios require a license for GMRS use.

Hi, i am new to this group. I took delivery of my new usb programming cable this morning and have had nothing but troubles. But my cable finally just overheated and burned out in the port.It was red hot to touch the chip end. I have done everything. Cut down the plug with the pins and tried all the drivers.

I am suspecting the poison pill syndrome as my little mini install cd had a picture of a very perplexed and sick looking panda face printed on the left hand side.

I took the chip end apart in its two halfs and the black chip inside was smokin. I don'tthink i have heard of anyone else on here so far whose cable has incinerated. It was the cheapest cable sold within the UK with software on e bay however.

Thanks

All kidding aside, the UV5r's affordability has allowed me to rekindle an interest in Ham radio specifically as a way to communicate when other options might not be available. I started thinking about getting a radio after the DC area Derecho storm , two summers ago, wiped out land lines and cell service for days. The Baofeng fits the bill for me and I am happy to do a little studying and get my ticket in order to use it. Making new friends in the Ham world is a bonus.

> First the UV-3R and UV-5R are different radios.

The various UV-3R models (UV-3R, UV-3R Mark II, UV-3R+) are actually
different radios that evolved at time went on.

The various UV-5R models (UV-5R, UV-5RA, UV-5RC and the list goes on) are
mostly variations in case styles. The electronics inside was the same.
There are a few models (UV-5RAX, UV-5RCX) that were specifically built to
operate on the VHF/220 bands instead of the more common VHF/UHF bands.

For a long time the "classic version" (UV-5R) was the only case style that
the extra capacity battery would fit without modification. There have been
some extra capacity batteries introduced recently that were designed to fit
some of the other case styles. If you plan to get an extra capacity
battery, you should do your homework to make sure the radio and batter you
purchase will fit out-of-the-box or be able to be modified to fit.

The UV-3R does not operate cross-band. The UV-5R does. I've never worked
satellites, but I think the cross-band capability is required which means
you would want a UV-5R. But I suppose you could use 2 UV-3R radios; one set
to VHF and the other set to UHF.

The various UV-3R models (UV-3R, UV-3R Mark II, UV-3R+) are actually different radios that evolved at time went on.

The various UV-5R models (UV-5R, UV-5RA, UV-5RC and the list goes on) are mostly variations in case styles. The electronics inside was the same. There are a few models (UV-5RAX, UV-5RCX) that were specifically built to operate on the VHF/220 bands instead of the more common VHF/UHF bands.

For a long time the "classic version" (UV-5R) was the only case style that the extra capacity battery would fit without modification. There have been some extra capacity batteries introduced recently that were designed to fit some of the other case styles. If you plan to get an extra capacity battery, you should do your homework to make sure the radio and batter you purchase will fit out-of-the-box or be able to be modified to fit.

The UV-3R does not operate cross-band. The UV-5R does. I've never worked satellites, but I think the cross-band capability is required which means you would want a UV-5R. But I suppose you could use 2 UV-3R radios; one set to VHF and the other set to UHF.

Thanks, the ends of the wires have definitely not been tinned before they were soldered to the board. They are splayed out on the pads but not quite touching each other as i can see. As for the rest of the board most of the components seen to be soldered in to place OK. But as they are all surface mount micro itens its hard to see if any of them may be the wrong way around ect. My bifocals are up to the job but i hate using my 30 watt battery powered iron. I took a Hora C408 apart yesterday that came from a well known and renowned ham radio dealer as a special. It wasn't receiving or tx well at all. The main fault was that the aerial socket wasn't even soldered to the board at all !! And lots of screws and other bits had ben left out meaning the volume pot was floating inside the case. No wonder it had dead spots on the af gain. But that item is off topic here. I guess if you tell these 3 world production lines to seed up two fold that's what happens. There are some good videos on you tube about the Ipod factory's and Andriod Tablet manufactures in China. They sleep in the factory's and have anti suicide nets around the outside of the buildings to catch roof jumpers.

I have glued the cable housing back together to send back to the retailer tomorrow.

Thanks

I am suspecting the poison pill syndrome as my little mini install cd had a picture of a very perplexed and sick looking panda face printed on the left hand side.

I took the chip end apart in its two halfs and the black chip inside was smokin. I don'tthink i have heard of anyone else on here so far whose cable has incinerated. It was the cheapest cable sold within the UK with software on e bay however.

Thanks

2E1HFH

Yes. This definitely something that has happened to others. A poor solder job on the USB end allowed the wires to short out. There used to be a picture of the cable with the shell removed showing the frayed wires. About 9 months ago there was a vendor that got a bad batch of cables and it was quite common for then to get hot and fail. If I remember, the vendor replaced the failed cabled without any hassle.

You can make you own programming cable using a CP2102 module from eBay. There are pictures in the group photo area. Look for "Homebrew Programming Cable-Part 1". I made mine for less

than $5 US.

A little trouble... i dropped the 82 in the charger this morning around 5:30am. At 9:45 (4.5hrs later) the light was still red. I found the contacts issue online. Thought to myself "ill give it another hour and then ill get the phillips head." Then dropped it back in the charger. Twenty min later I walked closeby the charger and smelled "that smell" ... you know the one! Ugh. Got the meter... found 8.2volts between the +and- on the base and 8.1 between + - on battery. Seems charged with no green light... ok so why the smell? Isnt the charger suppose to sense the battery there so there should be no voltage unless it is there? Confused... obviously worried about the very very faint smell (almost let he smoke out and I dont think I can put it back in smell) Ill bring more info after the next (being the second) charge. Any suggestions?

Public safety and business bands also need a license FOR THE AGENCY OR BUSINESS. FRS and MURS do not need licenses, but the radio is not legal to use there. For GMRS, you also need a license, but the radio is not legal to use there. There are no unlicensed frequencies this radio can legally be used on in the US. Ham use requires the individual to be licensed.

Perhaps the cells inside the battery (or one of them) are leaky. The only DC battery's that i have ever had that smelled on charge up were in an auto emergency lantern that i bought on a market stall. The charging circuit failed in the end. So i stripped the blighter down to try to fabricate a new board. But it had been put together in a way that meant that it would be almost impossible to re assemble it. What i found inside was a really modern 6 volt dc sealed acid scooter battery. I had only read about these at the time because it was way back in the very early 90,s when scooter batterys were all of the type that had to be topped up with de ionised water before charge.

I know that Motorola and kenwood high end pmr rig battery's are known to leak out in the rigs on charge or DC cable use. This normally destroys the circuit boards and turns the display inky black patches. There are some similar build factors between Kenwood and Baofeng as Kenwood mass produce some units in China.

But the Baofeng battery's clip off so you cant go wrong there.

I don't know about AUS, but the radio is not capable of or legal on the US CB frees. Just because the can physically transmit on certain frees doesn't mean it is legal, just as a lot of cars CAN go 120 mph doesn't make it legal to. You need to check what is and is not legal in AUS to do. I can only speak for the US. The US CB freqs are in the 11meter range, not UHF.

Hey thanks the CP2102 module on ebay looks pretty smart. Fewer components than the one in my cable and most of the better ones auto reset if crash or failure.This could stop the burnout problem..

Some guy gave me a really modern cb rig last week that just wouldn't tx or rx. I took off the covers and had a look inside and the whole thing cept the tuning vr,s and pots was surface mount and logic controlled. So i got out a set of mini croc jump leads and cross configured the mic pins and shorted a few points on the board in sequence rather like trying to jiggle the tumblers of an old padlock on a tool box. I had it going and freed up 100% in about 3 mins. Nice CB but no auto reset to the logic when it crashes and gets confused and locks up. This may be what happened to my cable. And as the boards are of a higher quality than the soldering to the cable they may not be produced by the fast buck guys who build the cables so cheaply.

I think a genuine Baofeng cable is in order here.

Just because the UV-5R can be programmed to a particular frequency does not mean it is legal to do so. There have been Australian group members claim to have had their UV-5R confiscated because it was capable of transmitting outside the Australian ham bands. YMMV.

Well, the answer is that is that in Australia, there is a 40 channel UHF Citizen's Band. Whether the radio itself is authorized for such use in Australia, depends on the laws there.

It may be technically possible to operate a UV-5R on the designated frequencies for those CB channels, but whether that's legal is another question. Some of the fines and punishments for improper CB usage in Australia seem quite severe.

In the UK it has been that frequencies have been available for public use but radio gear has to be approved and certified by the authorities before it can be sued on the said frequencies and bands. For example CB was in use here long before 1981 when it was legalised. But when CB became Ok all rigs had to bear the 27/81 stamp. The specifications outlawed most radios that had been used up to 1981 in one hit.

Mainly the specs are to prevent users from causing any interference to those on other spectrum's. Back when the UK got a three tier licence system like everywhere else, from foundation to advanced it was debated that the new foundation licence holders should also use only stamp marked approved gear. And that they should not be allowed to open up their radios, modify them or build homebrew kits and projects. But this idea was dumped. If they had put it through though it would have made a lot of money for the equipment producers and shops. The newbies would only have been able to buy rigs from the UK to use them legally.

Hi Richard:

Well, unless you can find the chapter and verse of some official Australian government document that -says- it is legal to use a UV-5R for CB use in Australia, I'd assume that it is not legal. Certainly, you can't get into trouble by -not- using it.

And, for amateur radio use, I'd consult the rules for that service. Here in the US, amateurs are given quite a bit of leeway as to what they may use for equipment, so long as whatever you are using meets the current technical specifications for emission quality. You can buy or build amateur gear, but it needs to meet current specs.

Thanks John K3NXU, i had the earpiece / mic that came with the radio out of the box about midday today. I was thinking of chopping it in half and bearing the ends of the cables and tinning them. I was going to solder this piece of work to the controller board of the USB plug of the cable.

I had taken to what i saw on miklor as my radio goes straight in to tx as soon as i put the cable in to any USB port. So it would have been reasonable to think that the jacks may not be right for my Baofeng. This however did not happen before the cable went barmy and baked itself. Also at this point i get a message from windows as well saying that the cable is not being recognised as it has malfunctioned.

Subject: [baofeng_uv5r] RE: My USB cable burned out

Hey thanks the CP2102 module on ebay looks pretty smart. Fewer components than the one in my cable and most of the better ones auto reset if crash or failure.This could stop the burnout problem..

Some guy gave me a really modern cb rig last week that just wouldn't tx or rx. I took off the covers and had a look inside and the whole thing cept the tuning vr,s and pots was surface mount and logic controlled. So i got out a set of mini croc jump leads and cross configured the mic pins and shorted a few points on the board in sequence rather like trying to jiggle the tumblers of an old padlock on a tool box. I had it going and freed up 100% in about 3 mins. Nice CB but no auto reset to the logic when it crashes and gets confused and locks up. This may be what happened to my cable. And as the boards are of a higher quality than the soldering to the cable they may not be produced by the fast buck guys who build the cables so cheaply.

I think a genuine Baofeng cable is in order here.

Thanks, the ends of the wires have definitely not been tinned before they were soldered to the board. They are splayed out on the pads but not quite touching each other as i can see. As for the rest of the board most of the components seen to be soldered in to place OK. But as they are all surface mount micro itens its hard to see if any of them may be the wrong way around ect. My bifocals are up to the job but i hate using my 30 watt battery powered iron. I took a Hora C408 apart yesterday that came from a well known and renowned ham radio dealer as a special. It wasn't receiving or tx well at all. The main fault was that the aerial socket wasn't even soldered to the board at all !! And lots of screws and other bits had ben left out meaning the volume pot was floating inside the case. No wonder it had dead spots on the af gain. But that item i s off topic here. I guess if you tell these 3 world production lines to seed up two fold that's what happens. There are some good videos on you tube about the Ipod factory's and Andriod Tablet manufactures in China. They sleep in the factory's and have anti suicide nets around the outside of the buildings to catch roof jumpers.

I have glued the cable housing back together to send back to the retailer tomorrow.

Thanks

Hi, i am new to this group. I took delivery of my new usb programming cable this morning and have had nothing but troubles. But my cable finally just overheated and burned out in the port.It was red hot to touch the chip end. I have done everything. Cut down the plug with the pins and tried all the drivers.

I am suspecting the poison pill syndrome as my little mini install cd had a picture of a very perplexed and sick looking panda face printed on the left hand side.

I took the chip end apart in its two halfs and the black chip inside was smokin. I don'tthink i have heard of anyone else on here so far whose cable has incinerated. It was the cheapest cable sold within the UK with software on e bay however.

Thanks

2E1HFH

Yes. This definitely something that has happened to others. A poor solder job on the USB end allowed the wires to short out. There used to be a picture of the cable with the shell removed showing the frayed wires. About 9 months ago there was a vendor that got a bad batch of cables and it was quite common for then to get hot and fail. If I remember, the vendor replaced the failed cabled without any hassle.

You can make you own programming cable using a CP2102 module from eBay. There are pictures in the group photo area. Look for "Homebrew Programming Cable-Part 1". I made mine for less than $5 US.

Unfortunately the "New" Yahoo! made it impossible to search for the message with the instructions. You can get a good idea how to do it from the Miklor.com website, though.

36933. programming access erratic

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-24 17:39:02 UTC
From: <m240zz@...>
Topic: 36933 Message: 36933

After going about 9 months w/o making any programming changes I decided to make some changes. All had worked fine before after trimming the cable plug. This time when I invoke the uv5r vip software it appears to progress about 20% thru the xfer process and then fails with unable to connect.

Just on a guess I decided to try the chirp software and it works although somewhat inconsistently. Usually the download from radio >pc works but not vice versa. Copying to radio fails about 30% of time.

If it gets no worse then I'm ok with it.

Anyone else observe this? Any settings changes suggested?

Subject: [baofeng_uv5r] Signal code

Hello everyone! I was wondering if someone could tell me what the signal code is. I just received my UV-5R PRO Ultimate 2013 version and i am working on programming it through software and was curious as to what the signal code is. I am not familiar with this feature with other radios that I have programmed.

Actually, if you are in the United States or Canada, you DO need a license to use this handheld.

If you are in some other country, it might or might not require a license depending on the laws and rules in that country.

But since you appear to be in Washington state – which is in the US – you DO need a license to operate this radio. The kind of license you have would determine which frequency or frequencies were legal to use.

Because the Baofeng is mega sophisticated and can make lots of ctcss tones and so on. Also it has lots of different channel steps meaning that you would often be heard tx,ing off channel. And of corse it has a healthy 5 watts out the aerial socket. I should think that the sound on air just wouldn't be the same as a legit cb either. The Baofeng will have an unrestricted front end, and if you look at the programming software for later models i think that you may see that you can vary thing like gain and attack. In short i should think that a thing like a cb that would be complying with any requirements laid down by authority's would most likely sound arther thin, wispy and maybe even tinny on both transmit and receive in order to keep the mod well with the very strict channel spacing and also to totally reduce the poss of harmonics or any spuriously generated signals on the rf board even from finding their way in to your colinear aerial or down your mains lead through your unfiltered Baofeng wall wart. Any type of approved radio will have all the nuts done up tight. So tight that it would most likely squeak.

Believe me an experienced listener would know if you have any commercial rig on the CB bands by the sound. And guys like the FCC would have detector vans and equipment to analyse any signals in order to produce evidence for prosecutors and so on.

A Baofeng is a fine thing OK. But it most likely most wouldn't get any type of approval stamp other than one for electrical safety. I for example have a haunted UV3R+. Even when its switched off its still receives short signals and very brief and strange sounding eastern sounding voices can sometimes eak their way from the speaker Mic.. Spooookkyy..!!! This was one of the early ones and came straight from China off ebay. At first i thought my palls were pranking me and had put a vox bug in it to hear me talk to myself in the shack. As it dose this almost always if the mains adaptor is fitted. But thats not the case. Its just like having a mogwia in a cage from Gremlins 2 . Cost was about 20 dollars and i wasn't shopping on ebay Europe, GB, or USA at the time. Radio is lovely though, i can access repeaters 15 miles away on a little two element chimney stack aerial and the hams at the other end think im local. I almost introduced the BF to Central London doing this.

But we here are hams and that licences us on International convention to experiment and make and receive signals. So therefore we can even build our own gear if we like. So using any radio let alone a BF is fine business. But we also all have a level of competence and technical training to oversee that we dont overstep the mark by accident or even on purpose.

Hi Richard:

Well, unless you can find the chapter and verse of some official Australian government document that -says- it is legal to use a UV-5R for CB use in Australia, I'd assume that it is not legal. Certainly, you can't get into trouble by -not- using it.

And, for amateur radio use, I'd consult the rules for that service. Here in the US, amateurs are given quite a bit of leeway as to what they may use for equipment, so long as whatever you are using meets the current technical specifications for emission quality. You can buy or build amateur gear, but it needs to meet current specs.

Yes and no. You may well find that CB equipment requires
type-approval, which the Baofeng hasn't got.

On the other hand, providing you keep within spec and don't
advertise what you've got, no-one is likely to care very much.

I have had that happen in the past with the leaky cells.. yet this smell came from the charging base. I had to stick my nose in it to insure thats where the smell came from. Im working on killing the batt been qso all day. Have to admitt these baofeng batts are pretty good.

--- In baofeng_uv5r@yahoogroups.com, <steven_o@...> wrote:
>
> Perhaps the cells inside the battery (or one of them) are leaky. The only DC battery's that i have ever had that smelled on charge up were in an auto emergency lantern that i bought on a market stall. The charging circuit failed in the end. So i stripped the blighter down to try to fabricate a new board. But it had been put together in a way that meant that it would be almost impossible to re assemble it. What i found inside was a really modern 6 volt dc sealed acid scooter battery. I had only read about these at the time because it was way back in the very early 90,s when scooter batterys were all of the type that had to be topped up with de ionised water before charge.
>

> I know you dont need a license to use this handheld,

That rather depends on where you are and what local regulations and/or laws apply. You might not, but you might, and if you do, you might get in trouble for not having one - how much trouble also depends on local laws.

> but what
> freq range is acceptable for normal hiking use?

That's a very difficult question to answer precisely.

For one thing, it depends on the terrain through which you will be going, and also the range you need. Will you be only communicating with your companions on the walk, or will you need contact with a base station? If the latter, how far away will it be?

For local point-to-point contact in low-lying fields and the occasional wood, UHF will be suitable and probably less susceptible to interference. For longer distances and more uneven land such as fell-walking, I'd be inclined to use VHF; it is less affected by terrain and thus can have a larger coverage area).

(I assume you know this, but for the benefit of readers who may not, I will take the liberty of giving this advice: if going walking at any distance from civilisation, always take precautions: take a mobile phone as well as the Baofeng, and a spare battery; decent maps of the area; sensible shoes and clothes; a whistle; and always make sure you tell someone your route before you set off.)

You might have a licence-free frequency allocation where you are going, so obviously that is the one to use; if it requires type-approval, your Baofeng will probably fall foul of that as it's not type-approved for anything. How concerned you need to be about that depends on the local rules and how zealous the PTT (/FCC/GPO/whatever it's called there) are. If you want to use it, make sure your signals remain within the specification. You might find it easier (and cheaper) to buy some ready-made licence-free sets for your party if you only want local comms within the group.

Obviously, it goes without saying that you don't just think of a number; don't transmit in an amateur band without a licence, don't transmit in a band used by the emergency services at all. Cause interference to anyone and you _will_ get done.

Wont make more power but will cause splatter on adjacent frequencies. You must have FM braodcasting pirates where you may live. Havant you noticed that the drum and bass jungle music type can be heard way down the band even if you tune on a little ultralight. And if you cant hear the signal cos your too far off then you can most likely hear the drum splatter instead. Thats because those guys use budget methods to get pre emphasis to their fm signal. Even going as far as to modulate tx,s with things like powerful mosfet amps. The rf power of such a signal may even be very low. But you can really hear it well like it was a big signal. Compressions dose the same thing. You could even apply compression to an fm signal by using a compressor when making an audio tape to tx.

RF power in terms of watts or voltage in out pp ect wont come in to the problem. Perhaps if you are thinking of AM then you may be able to consider PEP for reduced carrier mod esp.

To make a cb squeaky clean and watertight there needs to be lots of filtering all over the place. And things need turning down (anticlockwise) I should think even if that makes for a degrading sound overall as well.

And, for amateur radio use, I'd consult the rules for that service.
Here in the US, amateurs are given quite a bit of leeway as to what
they may use for equipment, so long as whatever you are using meets
the current technical specifications for emission quality. You can
buy or build amateur gear, but it needs to meet current specs.

Hello everyone! I was wondering if someone could tell me what the signal code is. I just received my UV-5R PRO Ultimate 2013 version and i am working on programming it through software and was curious as to what the signal code is. I am not familiar with this feature with other radios that I have programmed.

Since you are in Australia, you are subject to the laws and regulations of Australia.

I am not familiar with all the rules that apply in Australia, but I have seen multiple posts from various Australian users, both here and in other forums, expressing mixed experiences concerning this radio. Apparently Australia does have some sort of type acceptance program where radio transmitters are supposed to be certified for various frequencies. I don’t know for sure if the BaoFeng radios are approved for UHF CB or for VHF or UHF commercial use but the radios are definitely acceptable for ham radio use (and are mentioned on the Wireless Institute of Australia website).

See http://www.typeapproved.com.au/?p=86

From what other Australians have posted, some have had legal problems and others have had no problems under what seem to be the same circumstances, just depending on where they were located and who the official was that examined the radio. In general it sounds like a licensed ham radio operator whose radio is programmed with only ham frequencies usually has no problem with any authorities; but even licensed ham radio operators who have a mix of ham and CB frequencies programmed sometimes do have problems. There have also been reports of Australian customs occasionally blocking import of these radios although obviously most of the time the radios are imported with no questions.

See http://www.aurfscan.com.au/showthread.php?6754-Lock-down-a-baofeng-uv-5r-to-ham-frequencies for one example.

If you are concerned about the legal status of the radio, you would have to do some research in Australia, probably starting with the ACMA which seems to be the government agency responsible for regulating two-way radios in Australia http://www.acma.gov.au/

> Thanks for the info. How could anyone know that I was using a CB or the
> UV5R ?

One common way would be for you to tell them! People chatting on UHF CB frequently do tell other people what kind of radio they are using. People often forget that there are others listening besides just who they are talking to. I would bet that ACMA occasionally monitors CB frequencies in Australia just like the FCC occasionally monitors GMRS and FRS frequencies in the United States and Industry Canada does in Canada. The chances that any particular individual might be monitored at any particular place and time are small, but people do get caught.

Another common way would be just casual observation. This happens more often at places or events where radio users gather, but can happen almost anywhere. ACMA officials regularly attend hamfests (gatherings of ham radio operators) but either an ACMA or other official might simply just happen to notice someone using one of these radios - they are distinctive enough to be noticeable if the person happens to know what one looks like.

And finally, there is also the possibility of someone else telling the authorities. Anyone might notice you using the radio illegally (for example, as noted above) and pass the information along to the authorities. You might not think that anyone would want to get you in trouble, but as they say "Stuff Happens" and, of course, there are also some people who have a stronger regard for the regulations than others. Your ACMA would be the only 100% official answer.
http://www.acma.gov.au/

But it does seem that the answer is that it isn't legal except possibly on
the ham radio frequencies:

The guvvies will mostly only come in if someone reports some kind of interference to a dedicated service like television or broadcast radio programmes. The only other way that the guvvies are likely to come is if a real busybody gives you a right royal shopping and framing up.. Like the parson perhaps or local headmistress of a village school for instance decides to put you on the naughty step, make you wear a dunce hat and stand in the corner of the class. This type of thing is uncommon however, but possible. I there are subjects like boy scouts or youth clubs using your local frequencies then expect them to be policed as far as language and conduct is concerned.

But still, causing interference or otherwise an outright fitting up and being sent down the river are normally the only things that will get you booked for any type of contravening that will result in something as bad as court action and its consequences..

I called the Guvvies out on my neighbour a few years back. Her broadband powerline network that she uses to get Russian tv and media in her home was so stonky and broadbanded that it completely slaughtered all of my HF. Big downer.. The guvvies ordered her to stop and deist at once and forced her provider British Telecom to visit her home and de install her network. They wrote me a nice letter offering me free services for years if i would retract but i declined. The chicks on my estate have never looked at me the same since. But i have my HF back and thats my main joy.

Hi Richard:

Well, unless you can find the chapter and verse of some official Australian government document that -says- it is legal to use a UV-5R for CB use in Australia, I'd assume that it is not legal. Certainly, you can't get into trouble by -not- using it.

And, for amateur radio use, I'd consult the rules for that service. Here in the US, amateurs are given quite a bit of leeway as to what they may use for equipment, so long as whatever you are using meets the current technical specifications for emission quality. You can buy or build amateur gear, but it needs to meet current specs.

You would have to check with someone in your group, but if I'm not mistaken you are still required to get a license, just they call it cb and channelize it. A few other countries have UHF frequency 'cb' band and most that I hear of require licenses that end up sounding much like the tech license. The funny thing is, since they call it cb, does that mean if you traveled to the us, you couldn't use reciprocal agreement to use your radio on us frequencies?

Australian CB has a UHF FM band and a HF 11 Meter band.

As to Richard's question, since CB is covered by a Class Licence, you
can use all 80 channels on UHF, well at least the 76 that have been
approved for use, without needing to hold an individual operator's licence.

Note though that whether you can lawfully use the UV-5R on the Aus CB
band is a different question. It is not type approved for CB use.

http://www.typeapproved.com.au/?p=86

It seems pretty clear that the UV-5R is NOT TYPE APPROVED in Australia. The web page tells me that it is not approved for anything like we would have under the FCC Part 80 (marine), Part 90 (commercial), and Part 95 (personal, non-amateur).

Part 97 covers AMATEUR radio. Amateur radio equipment (other than high power amps) is not licensed in the U.S. The operator is responsible for using proper equipment.

However, these links do not mention AMATEUR use...I am guessing that in Australia, it is similar to the U.S. where the operator is licensed, not the equipment...in which case it may be legal to use this radio on those authorized amateur frequencies, but not on the Australian CB frequencies.

In the US, the radio IS Part 90 type accepted for Public Safety and Business use. There is no type acceptance for ham radio use. The radio can be used for these systems for LICENSED operators or agencies.

AUS CB appears to be UHF, 450-520 range. US CB is in the 27 MHz range. There is no recip agreement for this.

Richard, unlawfully using the radio is just one charge the ACMA could bring. Another is possession of a radio that you are not licenced to use, with an intention to use it. You may be able to argue that you transmitted using the CB, not the UV-5R but then run into trouble for merely having the Baofeng.

The Radio Communications Act is set out in such a way as that possession of unlicenced equipment is itself a presumption of an intention to use. However, it is what the lawyers call a "rebuttable presumption", in that it can be overcome by other evidence.

In my case, I hold an Advanced Amateur Licence, so I am licenced to use the UV-5R on the 2 Meter and 70 cms amateur bands that it covers. I was able to use that fact to rebut a "presumption" when a Radio Inspector came to visit me 2 years ago. My "intention to use" was only on those frequencies for which I am licenced. Mind you, he was looking for unlawful Wouxun radios that cover the area around 70 MHz. I didn't have one but he then asked about my two other Wouxuns that have coverage identical to the UV-5R., so the same principle applies.

I would have been less confident about being able to defend my possession had I not held the amateur licence and say, only had CB frequencies programed or other frequencies outside my licence conditions.

I suggest you look into getting a Foundation amateur licence. Apart fom anything else, it will open up a whole new range of use for your UV-5R

With regard to equipment approval in Australia.... from the Australian government's website on the matter:

The UV-5R is "Not Approved":

"Not Approved: Baofeng UV-5R
Published on July 4, 2012, by Admin in Not Approved Database.
Manufacturer: Baofeng Model: UV-5R Frequency: VHF 136-174 / UHF 400-480MHz Type Approval Status: Not Approved

Tags: BAOFENG, Illegal, Not Approved, UHF, UV-5R, VHF"

Not much need for interpretation. I guess that puts the topic to rest.

Ray,

I think the question is still open, however, on whether it can be used by amateurs in Australia on amateur frequencies.

The page you reference is for TYPE APPROVAL.

I believe this is similar to the FCC Parts 80, 90, and 95. As we have all seen, the radio is approved for Part 90, but not Part 80 or Part 95.

Until we get some clarification to the contrary, I am assuming that the Australian amateur radio system is similar to the U.S. system, where an amateur can use this radio (or any other) on the amateur frequencies.

36959. Antenna mounted on luggage rack on minivan

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-24 23:32:39 UTC
From: <plaisaeb@...>
Topic: 36959 Message: 36959

Question for all the antenna geeks out there:

What difference in performance would one expect in mounting a VHF/UHF antenna on the roof of a minivan with a mag mount versus mounting the same antenna on the luggage rack cross-bar in exactly the same position but approximately 2 inches above the roof's surface?

The position for both would be approximately in the center left/right and front/back.

Anyone done any tests?

ED,

I HAVE DONE EXACTLY THAT, USING A PIECE OF 1/4 " AL STOCK. IT WAS A LIP MOUNT AND WAS ABOUT 11/2" OFF THE ROOF. NEVER DID ANY TESTS BECAUSE IT DID WHAT I WANTED IT TO. OF COURSE, IT WAS CONNECTED TO A TM271A AND NOT A UV5R. I DID USE A HT AND IT WORKED OK, CERTAINLY BETTER THAT THE STOCK DUCKY. TRY IT, IF IT WORKS, GREAT. IF IT DOESN'T, BACK TO THE DRAWING BOARD.

Subject: [baofeng_uv5r] Antenna mounted on luggage rack on minivan

Question for all the antenna geeks out there:

What difference in performance would one expect in mounting a VHF/UHF antenna on the roof of a minivan with a mag mount versus mounting the same antenna on the luggage rack cross-bar in exactly the same position but approximately 2 inches above the roof's surface?

The position for both would be approximately in the center left/right and front/back.

Anyone done any tests?

Ed

Your assumption is correct, Ed. No type approval is required for radios
used on the Australian amateur bands.

Australia & New Zealand do not require a licence for 'UHF CB' radio.
Usually known here as 'PRS' - Public Radio Service
477 MHz

There is a better and far simpler route to be discovered for illegal activity and that is the good old SWL and via the online publications of DX clubs and scanning groups. Here in London online organs such as the London Amateur Radio Times list article and revile almost any outspoken or notable ham or radio user. Most have nicknames used by such groups and many may just as well have their own fan clubs. It could be said that not a squeak goes unheard by someone.

In the past before online groups and forums it was a simple matter to subscribe to postal lists and monthly mail out broadsheets. Most of these work on the basis that readers send in and pool their logging and observations which are then published and credited to them in the next group mail out. I have even seen shopping centre and arcade security frequencies listed like this if they provide interesting listening

Not many SWL, are total backwoodsmen who listen alone at the spur of the moment. Almost all will make logs of some sort and co operating in groups forums and clubs gives them a social scene and helps to cohere them. I was an avid SWL for years before i was licensed and still belong to most of the clubs now.I used to sit up all night by the receivers waiting for the dx or 11 meter activity to come in.

If word got to these types that radios like BF,s were favoured then all the evidence needed would be there for anyone in authority to draw upon.

> Thanks for the info. How could anyone know that I was using a CB or the
> UV5R ?

One common way would be for you to tell them! People chatting on UHF CB frequently do tell other people what kind of radio they are using. People often forget that there are others listening besides just who they are talking to. I would bet that ACMA occasionally monitors CB frequencies in Australia just like the FCC occasionally monitors GMRS and FRS frequencies in the United States and Industry Canada does in Canada. The chances that any particular individual might be monitored at any particular place and time are small, but people do get caught.

Another common way would be just casual observation. This happens more often at places or events where radio users gather, but can happen almost anywhere. ACMA officials regularly attend hamfests (gatherings of ham radio operators) but either an ACMA or other official might simply just happen to notice someone using one of these radios - they are distinctive enough to be noticeable if the person happens to know what one looks like.

And finally, there is also the possibility of someone else telling the authorities. Anyone might notice you using the radio illegally (for

example, as noted above) and pass the information along to the authorities.
You might not think that anyone would want to get you in trouble, but as
they say "Stuff Happens" and, of course, there are also some people who have
a stronger regard for the regulations than others. See

You only need to look in the other conversation under this title to see how anyone can tell if you bhave a BF or a CB. We have been going in to the matter in depth.

Hi Richard:

Well, unless you can find the chapter and verse of some official
Australian government document that -says- it is legal to use a UV-5R
for CB use in Australia, I'd assume that it is not legal. Certainly,
you can't get into trouble by -not- using it.

And, for amateur radio use, I'd consult the rules for that service.
Here in the US, amateurs are given quite a bit of leeway as to what
they may use for equipment, so long as whatever you are using meets
the current technical specifications for emission quality. You can
buy or build amateur gear, but it needs to meet current specs.

We had a case here of a licenced amateur using a radio on frequencies welloutside his licence conditions, who was visited by the Radio Inspector and had one radio confiscated. He believed he had been detected and tracked by the inspector joining and reading up on his activity via Yahoo groups. He also believed the inspector had been initially tipped off about his activity by older amateurs.

According to the inspector, who was the one to visit me several months later, ACMA had been alerted to the out-of-band activity by the offender's own Facebook page, where he openly talked about it.

That fact has been pointed out to ACMA, including by me. The simple fact is that no real training in administrative law has been given to ACMA field staff, so we are seeing examples of this stupid officious behaviour cropping up here and there. As you say, virtually any piece of commercially manufactured amateur radio equipment can transmit outside the Australian amateur allocations.

The key question they should focus on is whether it is being used outside the allocations or whether there is an intention to use it outside the allocations. They are the questions their own law requires to be addressed.

Then programme your Baofeng so that it is within band limits. Here in the uk we can convert things like old taxi and police radios for use on the ham bands. And we dont need a licence variation to do so. Can you tell me if the use of converted commercial gear is allowed in Aus please thanks.

As for the BF it has full CTCSS and the keypad can make DTMF tones. That means that it should be AOK for use with echolink connected repeaters and nodes. I know there are plenty of Aussies who use echolink to talk back to GB and Europe in general. I have palls who have sceds with them.

Here in GB there have always been folks who will say that you cant have a radio if it can go out of band. Then my trusty old Kenwood TS520 must be a pirate barn blaster as this item tunes anywhere upwards of 600kc from the bottom off all its operating bands. This means that i can listen to international shortwave broadcasts in ecss (carefully tuned sideband). Here in Europe hams can often be heard hooting in the background to megawatt stations like CRI or VOR. This may be because that have older radios that cant have band edges programmed in as they tune mechanically. But most synthesised radios will go general coverage by taking off the lid and setting a jumper, flipping a switch or cutting a diode.

It is normally the responsibility of the user to stay in the band. And in the UK its a requirement to have a copy of the official band plan document at the station address along with the log book.

Thanks

While our FCC here in the USA isn't yet actively persuading illegal usage, at any moment. And when they would I'm sure those on list like this one will first check out those users who have openly touted using these, and other, radios illegally.

As I've noted before, we all know our government is always in need of funds. Having the FCC issue thousands of NLA's for thousands of dollars each would quickly help. While it may never happen, why take the chance?

Assuming both antennas were exactly the same, and both were properly installed and grounded, I think the main difference you'd notice would be the antenna pattern, but beware as many factory installed roof racks have poor grounding, which is why some use 1/2 wave antennas for roof rack mounts.

Thanks, it would be disconcerting to believe that a country like Aus with the Queen on its postage stamps would be so far diff from the UK. I should think that the procedures that your radio investigation and prosecution agencies apply would run along similar line also.

I know of people who have had the knock on the door from the inspector myself. And they are always the brash ones who insist on running 400 watts minimum and having a 2KW linear on standby. Most often they are the type who get their licenses by attending a club who will coach them in stages and sitting exams where they have been trained to answer the problems parrot style. One guy who claimed to be a full license holder had the knock and was following me around like a puppy at work begging me to build him some meters and test gear so he could prove his equipment didn't radiate out of band. He had a about 5 grandsworth of gear and a tower all on tick from a dealer and no gear to comply with EMC checking.

I just told him to go and buy a little SW radio and tell the inspector that he listens on twice the frequency when he tunes up to see there are no harmonics. I dont think the inspector can argue much with that and it would tick a few boxes.

---In baofeng_uv5r@yahoogroups.com, <wrmaxwell@...> wrote:

Yes Steven, converted commercial gear can and is routinely used on the Australian amateur allocations and like you, we need no licence variation to do so.
On 25/11/2013 5:26 PM, steven_o@... mailto:steven_o@... wrote:

Then programme your Baofeng so that it is within band limits. Here in the uk we can convert things like old taxi and police radios for use on the ham bands. And we dont need a licence variation to do so. Can you tell me if the use of converted commercial gear is allowed in Aus please thanks.

As for the BF it has full CTCSS and the keypad can make DTMF tones. That means that it should be AOK for use with echolink connected repeaters and nodes. I know there are plenty of Aussies who use echolink to talk back to GB and Europe in general. I have palls who have sceds with them.

Here in GB there have always been folks who will say that you cant have a radio if it can go out of band. Then my trusty old Kenwood TS520 must be a pirate barn blaster as this item tunes anywhere upwards of 600kc from the bottom off all its operating bands. This means that i can listen to international shortwave broadcasts in ecss (carefully tuned sideband). Here in Europe hams can often be heard hooting in the background to megawatt stations like CRI or VOR. This may be because that have older radios that cant have band edges programmed in as they tune mechanically. But most synthesised radios will go general coverage by taking off the lid and setting a jumper, flipping a switch or cutting a diode.

It is normally the responsibility of the user to stay in the band. And in the UK its a requirement to have a copy of the official band plan document at the station address along with the log book.

Thanks

2E1 HFH

Ray,

I think the question is still open, however, on whether it can be used by amateurs in Australia on amateur frequencies.

The page you reference is for TYPE APPROVAL.

I believe this is similar to the FCC Parts 80, 90, and 95. As we have all seen, the radio is approved for Part 90, but not Part 80 or Part 95.

Until we get some clarification to the contrary, I am assuming that the Australian amateur radio system is similar to the U.S. system, where an amateur can use this radio (or any other) on the amateur frequencies.

We seem to have conflicting statements here.

Can anyone give us a link or chapter and verse where the ACMA says the
UV5R is not allowed for amateur use?

If the criterion is "not tuning over the band edges" then I imagine
practically every ham radio on the market today would be disqualified.

There should be very little difference between the two installations you mention. If you are talking about a mag mount in both cases, both will be using the minivan roof as the major ground plane, two inches of additional spacing won't make much difference. Assuming the crossbar is conductive, it would make some small difference in the radiation pattern, probably slightly increasing signal strength to the two sides, but the large metal roof of the minivan will be the main factor in the overall radiation pattern. If the antenna mounted to the crossbar is mounted in such a way that there is an electrical connection between the coax shield and the crossbar that would enhance the ground plane effect of the crossbar. In that case I would expect a somewhat greater added lobe to each side of the radiation pattern, but the roof of the minivan will still probably be the major element determining the overall radiation pattern.

Subject: [baofeng_uv5r] Antenna mounted on luggage rack on minivan

Question for all the antenna geeks out there:

What difference in performance would one expect in mounting a VHF/UHF antenna on the roof of a minivan with a mag mount versus mounting the same antenna on the luggage rack cross-bar in exactly the same position but approximately 2 inches above the roof's surface?

The position for both would be approximately in the center left/right and front/back.

Anyone done any tests?

Yes, most people who get caught are caught because either they told on themselves or because they annoyed someone who respects the regulations more than they do. Frequently it is a combination of both.

As many have noticed here, most older hams tend to take the regulations more seriously than the kids who got their license out of a box of crackerjacks by memorizing the answers to a few test questions. Even though some of those older hams may bend or even break a few rules, they are generally careful not to be stupid about it.

Meanwhile the same mentality that leads some people to feel they have no need to follow any regulations also leads those same people to brag about breaking the rules. Bragging about breaking the law is fine if you are sure you are only bragging to other criminals, but even other criminals may turn you in for one reason or another.

And, from everything I have heard, your ACMA is a lot more proactive and our FCC.

From: Bill Maxwell

We had a case here of a licenced amateur using a radio on frequencies well outside his licence conditions, who was visited by the Radio Inspector and had one radio confiscated. He believed he had been detected and tracked by the inspector joining and reading up on his activity via Yahoo groups. He also believed the inspector had been initially tipped off about his activity by older amateurs.

According to the inspector, who was the one to visit me several months later, ACMA had been alerted to the out-of-band activity by the offender's own Facebook page, where he openly talked about it.

There is a common issue with folks that knowingly and intentionally violate one law they have the probability to violate other laws. The laws governing Ham Radio are in reality set up to make Hamming a great experience. I remember the 70-80 when CB went down the drain with uncontrolled trash.....
Taking a ham radio and tweaking it to work off Freq. is against the law... If you are a lic. operator and you either tweaked it or used it you could loose your lic. plus a fine.

For the most part it not hams here in the USA that are using these radios on non ham frequencies. Instead it is non licensed users who used to buy the cheap junky bubble pack GMRS/FRS radios who are finding theses radios have more power, more choices of frequencies, etc... I still think its only a matter of time until unlicensed users will start showing up on ham repeaters with the only fix to change tones and finally shut them down. Yes you can hunt then down but when it becomes multiple users every day how long before you can't keep up?

at least in the US the Amateur Radio Service is a self-policing service dependent on Hams to keep it clean--ive never seen a Ham violating the rules who did not receive at least one friendly warning to knock it off before someone called the FCC---but some people do not listen to good advice and that is a problem not just in Ham Radio

Maybe someone could come up with a Raspberry Pi program to do the radio ID stuff so people can block out specific radios when someone is abusing the repeater?

I have used antennas that don't require ground planes on minivans made of fiberglass or composites on luggage racks. Works good. I believe you need either a 1/2 wave or 5/8 wave antenna"

> On Nov 25, 2013, at 9:42, "Xaun Loc" <xaunloc@...> wrote:
>
> There should be very little difference between the two installations you mention. If you are talking about a mag mount in both cases, both will be using the minivan roof as the major ground plane, two inches of additional spacing won’t make much difference. Assuming the crossbar is conductive, it would make some small difference in the radiation pattern, probably slightly increasing signal strength to the two sides, but the large metal roof of the minivan will be the main factor in the overall radiation pattern. If the antenna mounted to the crossbar is mounted in such a way that there is an electrical connection between the coax shield and the crossbar that would enhance the ground plane effect of the crossbar. In that case I would expect a somewhat greater added lobe to each side of the radiation pattern, but the roof of the minivan will still probably be the major element determining the overall radiation pattern.

A lot of commercial radios don't need to be tweaked, they will already do ham freqs (like the Baofeng 5's). The older radios just needed a service tech to program them, which makes them highly inconvenient to use on ham. I really love being able to program my own radios.

Having nothing better to do this afternoon, I read the whole of this document, all 45 pages of it....

wherein I found this, among other interesting information...Paragraph 24 clearly states that the operator must transmit inside the band...it says nothing about the radio's ability to transmit outside the band.

...the rest of the document reads like the FCC Part 97 where operations/limits/restrictions/power limits/frequency allocations/etc of an amateur station are delineated.

There is no mention whatsoever of any particular equipment.

This document and further information on the technical aspects of transmitting using an amateur station can be found here http://www.wia.org.au/members/legislation/determinations/

Also see this Radiocommunications Licnce Conditions (Apparatus Licence) Determination 2003 - May 2013.pdf <http://www.wia.org.au/members/legislation/determinations/documents/Radiocommunications%20Licnce%20Conditions%20%28Apparatus%20Licence%29%20Determination%202003%20-%20May%202013.pdf>
...again no mention of any particular equipment...only the operational parameters of an amateur station are delineated.

So, unless my understanding is way off base, it seems that amateurs in Australia should be able to use the UV-5R on Australian amateur frequencies to their hearts' content.

Well done Ed, although if I had known you were going to that length I would probably have tried to save you the trouble.

Our problem in Australia is not with Draconian statutes nor Determinations such as these. The problem is rather the inadequate training and lack of standards within our regulator ACMA. The Radio Inspector who visited me freely admitted that he had never received any training in administrative law and that he was unsure how he should read the relevant sections of the legislation, yet he was at first very sure that his understanding was correct, because he had it from his boss.

I had the benefit of 38 years experience in administrative law, so I sat him down and took him through it, section by section. In the end he agreed with me that possession of a radio that could transmit outside my licence conditions was illegal only if I had an intention to use it outside those conditions. Once we reached that point, he was happy to receive my assurance, later repeated in writing, that I had no such intention.

I have been hoping the WIA, our ARRL equivalent, will take this inconsistency up with ACMA and get some policy guidance out to ACMA field staff but sadly, this does not appear to have happened. The tragic sudden death of Michael Owen, in office as our WIA National President, a year or so back was probably a factor in this. Just before his death, Michael who was an leading barrister and attorney, wrote an article in our Amateur Radio magazine, in which he traced through the legislation and arrived at an interpretation identical to my own. Had he still been with us, I think we might not be in our present position of confusing inconsistency still being demonstrated by ACMA staff members.

Anyway, this topic has probably already taken up too much of the group's time, given our international membership.

Bill,

Thanks for the positive feedback...I agree that these topics take up too much time...but when I see people coming back with blanket statements, I prefer to research the pursuant documentation and let it speak for itself, rather than engage in ad hominem attacks, as happens too often here.

Anyhow, I look at it as time well spent and feel well versed in Australian amateur radio administrative law. :-)

From: Stan Labinsky Jr.
Topic: 36959 Message: 36993

You’re partially right. The half wave, yes. The 5/8ths, no. That one needs the largest ground plane it can find to work as advertised.

Stan

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Antenna mounted on luggage rack on minivan

I have used antennas that don't require ground planes on minivans made of fiberglass or composites on luggage racks. Works good. I believe you need either a 1/2 wave or 5/8 wave antenna"

Sent using Magic Decoder Ring found in Cracker Jacks box 25 years ago.

On Nov 25, 2013, at 9:42, "Xaun Loc" <xaunloc@...> wrote:

There should be very little difference between the two installations you mention. If you are talking about a mag mount in both cases, both will be using the minivan roof as the major ground plane, two inches of additional spacing won’t make much difference. Assuming the crossbar is conductive, it would make some small difference in the radiation pattern, probably slightly increasing signal strength to the two sides, but the large metal roof of the minivan will be the main factor in the overall radiation pattern. If the antenna mounted to the crossbar is mounted in such a way that there is an electrical connection between the coax shield and the crossbar that would enhance the ground plane effect of the crossbar. In that case I would expect a somewhat greater added lobe to each side of the radiation pattern, but the roof of the minivan will still probably be the major element determining the overall radiation pattern.

Subject: [baofeng_uv5r] Antenna mounted on luggage rack on minivan

Question for all the antenna geeks out there:

What difference in performance would one expect in mounting a VHF/UHF antenna on the roof of a minivan with a mag mount versus mounting the same antenna on the luggage rack cross-bar in exactly the same position but approximately 2 inches above the roof's surface?

The position for both would be approximately in the center left/right and front/back.

Anyone done any tests?

When they do turn up on the repeaters simply turn them into hams. They probably dont know they are violating the law and will be glad your letting them know. Help them real information and tell them how to use the radio legally. Give them study information and a test date/location to come take the test. Sign them up for your local hum club. BUT WHAT EVER YOU DO DONT BE A DICK ABOUT IT. Be polite and helpful and you might find you will have a lot more people to chat with legally on the local repeater and more money in the local ham club budget.

just my 2 cents

36995. Setting up channels on CHIRP

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-26 07:46:01 UTC
From: Nathan Chidester
Topic: 36995 Message: 36995

Hello,
I am trying to setup my radio to do the following, I don't know if it is possible with the UV5R+, but if so, could someone please explain what I need to do in CHIRP.

I would like to be able to scan the freqs. in Channel A, while when I need to transmit on a Freq. on Chanel B, which is stationary---how do I set that up? Also, I have been reading things online, and the manual and when I attempt to change from Channel A to Channel B, and change that freq. my radio seems to not want to stay on Channel B so I can manually change the channel, if I want to transmit on another freq.

Hope that makes sense.

Thanks,
Nathan Chidester

No. CB radios are covered by a class licence only if they are approved.
Also there are now 77 legal CB channels.

It is an offence to possess a transmitter for which you don't have a
current license.
An amateur radio license allows possession and use within amateur
radio regulations
even if the radio is capable of transmitting outside amateur bands.

In Australia there are 77 CB channels from 476.425 to 477.400.
There were 38 but the ACMA halved the channel spacing to 12.5 Khz.

Incorrect. Any radio that can be used within amateur radio regulations
is legal to use within those regulations.
I am allowed to use a 3,000 watt linear as long as it is adjusted to
400 watts or below.

Prior to enumeration of a device, USB will supply a maximum of 100 mA at 5 V. During enumeration, the device can request, and USB will deliver, up to 500 mA at 5 V. In the scenario at hand, the post-enumeration number is the controlling one.

"Red hot" may have been an exaggeration, but there is more than enough juice available to produce plenty of smoke.

I saw a video of a CB shoot out where one radio was installed in a van with
V8 engine driving six large alternators and boosted with nitro oxide.
It needed that because the radio was rated at 70,000 watts output.

>Mainly the specs are to prevent users from causing any interference

>the UK to use them legally.

In Australia foundation licensees are only allowed to use
commercially made equipment
and only up to 3 watts AM/FM and 10 watts PEP SSB.

You don't have 75/80, 40, 20, etc ham bands? VHF is 2meter, UHF is 70cm. What do AUS hams call their bands?

> up?
>
First in the CHIRP Memories spreadsheet editor make sure "the freqs" that
you want to scan are all set to {blank} (no "S" is showing) in the "Skip"
column so that these channels will in the SCAN_ADD list (the list of
channels that are permitted to be scanned by the UV-5R) after they are
uploaded to the radio.

Second go to the "Settings" -> "Work Mode Settings" menu and set "MR B
Channel" to the channel number that you want selected in the MR [B]
display. This will preselect this channel in the MR [B] display after the
upload to the radio is finished. While the "Work Mode Settings" menu is
still selected you may also want to set "VFO/MR Mode" to "Channel" so that
the radio will be in MR mode after the upload is finished. Note: MR =
Memory = Channel

> Also, I have been reading things online, and the manual and when I attempt
> to change from Channel A to Channel B, and change that freq. my radio seems
> to not want to stay on Channel B so I can manually change the channel, if I
> want to transmit on another freq.
>
This is because on the "Settings" -> "Advanced Settings" menu you have
"Dual Watch" enabled AND "Dual Watch Priority" set to "A". "Dual Watch"
(aka TDR) causes the UV-5R to scan between the frequencies (VFO mode) or
channels (MR mode) selected in the [A] and [B] displays. Normally whichever
display receives a signal last becomes the selected display. Whenever "Dual
Watch Priority" is set to "A" or "B", then when a signal received on the
other display goes away, the display selection is forced back to the "Dual
Watch Priority" selected display.

So in your case, to change the frequency or channel setting of the [B]
display you have to first set menu 7 (TDR) of the UV-5R to OFF, make the

needed change to the [B] display, and then set TDR back to ON.

But to do what you want to do, you will have to set "Dual Watch" to disabled (no tick mark). This is because the UV-5R cannot scan the channels/frequencies of a display (long press [*SCAN] key) AND scan between the displays (Dual Watch) at the same time.

So if your [B] display channel being scanned in the [A] display only once in every 128 channels (or however many you have set to be scanned in the SCAN_ADD list), then you will have to program your "B" channel multiple times and spaced out within your channels so that it will be scanned more often. I hope that makes sense?

> Hope that makes sense.
>
I believe I understood what you are asking.

>
> Thanks,
> Nathan Chidester
>
What you have to remember is that the UV-5R is not a scanner that is also a two-way radio. It is a two-way radio that also a scanner. So don't expect its ability to scan frequencies/channels to be on-par with a dedicated scanner. I don't expect much from it, so it works fine for me. YMMV.

3rd party communications are still ham to ham on the behalf of another.
US amateur law forbids communications on amateur frequencies to a non ham.

Scott;

You may want to bone up on Part 97 yourself.

There are many instances of hams being able to talk to non-hams and to pass messages to the "general public". It's called "Third Party Communications".

These might include GOTA (Get On The Air) stations at Field Day, JOTA (Jamboree On The Air) stations during scouting events and traffic handling.

§ 97.3 Definitions.

(a) The definitions of terms used in part 97 are:

(47) Third party communications. A message from the control operator (first party) of an amateur station to another amateur station control operator (second party) on behalf of another person (third party).

§ 97.115 Third party communications.

(a) An amateur station may transmit messages for a third party to:

(1) Any station within the jurisdiction of the United States.

(2) Any station within the jurisdiction of any foreign government when transmitting emergency or disaster relief communications and any station within the jurisdiction of any foreign government whose administration has made arrangements with the United States to allow amateur stations to be used for transmitting international communications on behalf of third parties. No station shall transmit messages for a third party to any station within the jurisdiction of any foreign government whose administration has not made such an arrangement. This prohibition does not apply to a message for any third party who is eligible to be a control operator of the station.

(b) The third party may participate in stating the message where:

(1) The control operator is present at the control point and is continuously monitoring and supervising the third party's participation; and

(2) The third party is not a prior amateur service licensee whose license was revoked or not renewed after hearing and re-licensing has not taken place; suspended for less than the balance of the license term and the suspension is still in effect; suspended for the balance of the license term and re-licensing has not taken place; or surrendered for cancellation following notice of revocation, suspension or monetary forfeiture proceedings. The third party may not be the subject of a cease and desist order which relates to amateur service operation and which is still in effect.

I ordered a genuine Baofeng cable from the UK importers and now my programming software works. I can use both the Baofeng software and Chirp as well. But i do need a bit of thumb pressure on the plugs to start the reading as they seem a little offset.

The vendor who sold me the poison pill software and firefly incinerator cable will only give me what he says are proper instructions as recompense for the fact that his cable melted down in my USB port. I think i will just chop the end off his cable and go buy a serial chip from e bay and rebuild and brand it my own.

Thanks to all on the group for the help that i have been given.

A lot of hams seem to believe that a radio that tunes over the band edges is out of order and highly illegal.

Most of the time this statement comes from what i call "black box operators". These are the folk who will only buy a radio from a renowned and well known dealer. And mostly always of a brand they see as being reputable. Normally these chaps are lulled in to a sense of false security by the fact that the dealer has sold them the radio on hire purchase credit and told them that the equipment has an endless warranty, so long as their custom is retained. This type of wide ball sales pitch will bring these types back to the shop as and when any simple fault crops up with any of their radios of their station.

People like this are much like sheep. Some say that things like sheep dont deserve to be here becase what we have is far to good for them. But if it wasn't for these people the main dealers like Icom and Yaesu would do very badly and a lot of dealerships would collapse over time. In the long run they keep the price of new gear down. They also keep the second hand market afloat as they so often sell of radios that they believe are faulty or wont perform as they think they should. For example someone who reads an add in a magazine that says that six meters is the magic band and then finds that there is nothing to be heard on his new radio. Of course six meters may well be magic but all depends on propagation and ducting. So the poor chap sits at home with his new radio feeling highly disconcerted as it just sits there on the table before him with no signals. In time he will most likely doubt that the radio even produces any signal when he speaks as he hears no one reply.

Over the years i have come to see also that black box men typically have no technical skill. I have found them most often to be people who have had no technical training during their lives and they also often work in very manual jobs that require little or no thought or learning curve.

A cheap and versatile radio like a Baofeng is a worrying thought to such a person and reading on here at our activity's will only wind them up. Its a bit like little old ladies who decide that their poodle is developing criminal tendency and activity because he sniffs other dogs watering posts.

In the end it all comes down to psychology.

Red hot is pretty much a vernacular term in the UK ver of English to describe something that is much hotter than one would expect. For example if your mom gives you your dinner and you put a potatoe in your mouth and find you can barely hold it there for the pain. One would normally exclaim " ITS RED HOT MUM !! ".

The same goes if someone runs you a bath and that's to hot as well. Even though water cant be "red hot".

Prior to enumeration of a device, USB will supply a maximum of 100 mA at 5
V. During enumeration, the device can request, and USB will deliver, up to
500 mA at 5 V. In the scenario at hand, the post-enumeration number is the
controlling one.

"Red hot" may have been an exaggeration, but there is more than enough juice
available to produce plenty of smoke.

I asked Industry Canada | Industrie Canada that question and this is what they say.

Thank you for your query in regard to type approvals for Amateur Radio gear in Canada.

Radio equipment used within the Canadian Amateur Radio Service requires no approval by Industry Canada. It is the responsibility of the operator to ensure that all equipment is operated in compliance with the frequency and emission limits specified for the Canadian Amateur Radio Service and within the privileges afforded by the operator's class of certificate.

The Amateur Radio Service has always been considered to be an experimental radio service and operators are encouraged to design, build or modify their equipment and to experiment with various methods and modes of radio communications within the confines of their certificates.

However; Basic/Basic(+) operators are restricted to the use of commercial radio equipment that has been specifically designed for use within the Amateur Radio Service.

I trust that this has provided the answer to your query.

Spectrum Management Officer | Agent, Gestion du spectre
Spectrum Management Operations Branch | Direction générale des opérations de la gestion du spectre
Spectrum, Information Technologies and Telecommunications Sector | Secteur du Spectre, des technologies de l'information et des télécommunications

A lot of hams seem to believe that a radio that tunes over the band edges is out of order and highly illegal.

Most of the time this statement comes from what i call "black box operators". These are the folk who will only buy a radio from a renowned and well known dealer. And mostly always of a brand they see as being reputable. Normally these chaps are lulled in to a sense of false security by the fact that the dealer has sold them the radio on hire purchase credit and told them that the equipment has an endless warranty, so long as their custom is retained. This type of wide ball sales pitch will bring these types back to the shop as and when any simple fault crops up with any of their radios of their station.

People like this are much like sheep. Some say that things like sheep dont deserve to be here becase what we have is far to good for them. But if it wasn't for these people the main dealers like Icom and Yaesu would do very badly and a lot of dealerships would collapse over time. In the long run they keep the price of new gear down. They also keep the second hand market afloat as they so often sell of radios that they believe are faulty or wont perform as they think they should. For example someone who reads an add in a magazine that says that six meters is the magic band and then finds that there is nothing to be heard on his new radio. Of course six meters may well be magic but all depends on propagation and ducting. So the poor chap sits at home with his new radio feeling highly disconcerted as it just sits there on the table before him with no signals. In time he will most likely doubt that the radio even produces any signal when he speaks as he hears no one reply.

Over the years i have come to see also that black box men typically have no technical skill. I have found them most often to be people who have had no technical training during their lives and they also often work in very manual jobs that require little or no thought or learning curve.

A cheap and versatile radio like a Baofeng is a worrying thought to such a person and reading on here at our activity's will only wind them up. Its a bit like little old ladies who decide that their poodle is developing criminal tendency and activity because he sniffs other dogs watering posts.

In the end it all comes down to psychology.

Scott;

You may want to bone up on Part 97 yourself.

There are many instances of hams being able to talk to non-hams and to pass messages to the "general public". It's called "Third Party Communications".

These might include GOTA (Get On The Air) stations at Field Day, JOTA (Jamboree On The Air) stations during scouting events and traffic handling.

§ 97.3 Definitions.

(a) The definitions of terms used in part 97 are:

(47) Third party communications. A message from the control operator (first party) of an amateur station to another amateur station control operator (second party) on behalf of another person (third party).

§ 97.115 Third party communications.

(a) An amateur station may transmit messages for a third party to:

(1) Any station within the jurisdiction of the United States.

(2) Any station within the jurisdiction of any foreign government when transmitting emergency or disaster relief communications and any station within the jurisdiction of any foreign government whose administration has made arrangements with the United States to allow amateur stations to be used for transmitting international communications on behalf of third parties. No station shall transmit messages for a third party to any station within the jurisdiction of any foreign government whose administration has not made such an arrangement. This prohibition does not apply to a message for any third party who is eligible to be a control operator of the station.

(b) The third party may participate in stating the message where:

(1) The control operator is present at the control point and is continuously monitoring and supervising the third party's participation; and

(2) The third party is not a prior amateur service licensee whose license was revoked or not renewed after hearing and re-licensing has not taken place; suspended for less than the balance of the license term and the suspension is still in effect; suspended for the balance of the license term and re-licensing has not taken place; or surrendered for cancellation following notice of revocation, suspension or monetary forfeiture proceedings. The third party may not be the subject of a cease and desist order which relates to amateur service operation and which is still in effect.

Hams aren't allowed to talk to non-hams on amateur frequencies. Messages may only be sent to another amateur. Not even messages for the general public are allowed.

Did you ever read Part 97?

I've got an old FT101, works nicely at the HF end of medium wave
(/me reminisces about the old 186 nets). Most kit will operate
out of band (or can easily be made to); as you say, it's up to
the operator to ensure s/he keeps to the regulations.

Actually, Bryce, the fact is that Scott was much closer to correct. For it to be third party traffic, there first has to be a THIRD party. That is third, as in other than the TWO hams who are the control operators at each end of the conversation. In the situation originally described, a non-ham simply showing up on a ham repeater one day, it isn't "third party communications" because there is no ham to be the control operator at the non-ham's end of the conversation.

It would be legal for a ham to very briefly talk with the non-ham, first to determine if he is a licensed ham, and then once he determines that the intruder is unlicensed to tell him he cannot use the repeater – but the kind of extended conversation that would be involved in recruiting the non-ham into amateur radio is far beyond anything legal under Part 97. Once the amateur determines that the other station is in violation of 97.7, then continuing the conversation would be a violation of 97.101(a)

See sections 97.115(b)(1); 97.7; and 97.101(a)

(1) Any station within the jurisdiction of the United States.

(2) Any station within the jurisdiction of any foreign government when transmitting emergency or disaster relief communications and any station within the jurisdiction of any foreign government whose administration has made arrangements with the United States to allow amateur stations to be used for transmitting international communications on behalf of third parties. No station shall transmit messages for a third party to any station within the jurisdiction of any foreign government whose administration has not made such an arrangement. This prohibition does not apply to a message for any third party who is eligible to be a control operator of the station.

(b) The third party may participate in stating the message where:

(1) The control operator is present at the control point and is continuously monitoring and supervising the third party's participation; and

(2) The third party is not a prior amateur service licensee whose license was revoked or not renewed after hearing and re-licensing has not taken place; suspended for less than the balance of the license term and the suspension is still in effect; suspended for the balance of the license term and re-licensing has not taken place; or surrendered for cancellation following notice of revocation, suspension or monetary forfeiture proceedings. The third party may not be the subject of a cease and desist order which relates to amateur service operation and which is still in effect.

Hams aren't allowed to talk to non-hams on amateur frequencies. Messages may only be sent to another amateur. Not even messages for the general public are allowed.

Did you ever read Part 97?

When they do turn up on the repeaters simply turn them into hams. They probably dont know they are violating the law and will be glad your letting them know. Help them real information and tell them how to use the radio legally. Give them study information and a test date/location to come take the test. Sign them up for your local hum club. BUT WHAT EVER YOU DO DONT BE A DICK ABOUT IT. Be polite and helpful and you might find you will have a lot more people to chat with legally on the local repeater and more money in the local ham club budget.

just my 2 cents

at least in the US the Amateur Radio Service is a self-policing service dependent on Hams to keep it clean--ive never seen a Ham violating the rules who did not receive at least one friendly warning to knock it off before someone called the FCC---but some people do not listen to good advice and that is a problem not just in Ham Radio

Excellent.

I think we should be seeing a pattern here because there /is/ a pattern here.

Like the Mythbusters on TV, hopefully some of these myths will disappear, for a while at least. Like urban legends, they keep coming back.

If only everyone could see the simple dichotomy: the two-way radio world is basically AMATEUR and NON-AMATEUR.

Amateurs are licensed by their governments and can operate /any /kind of equipment that meets the general requirements for transmitting, but they can only operate on designated frequencies with specified power limits and any other defined restrictions.

Non-amateurs (business/emergency/personal/private/whatever) can only operate specific equipment which has been approved by the government for their purposes. This equipment is labeled as such by the manufacturers. (Baofeng UV-5R: Part 90 in the USA, for example) Licenses, where required, are issued to entities/persons based on the knowledge that the authorized equipment will perform as required for that purpose.

It is interesting that both Canada and Australia share a requirement for the lowest level of amateur rating "... restricted to the use of commercial radio equipment that has been specifically designed for use within the Amateur Radio Service."

This would preclude homebrew transmitters for them at that level, it seems.

In addition to the link provided each radio transmitter or receiver has at least one oscillator usually 2 or more.

Each and every oscillator has Phase noise (rise and fall time jitter) and no two are the same, so if we put the two in to a signature your radio can be identified every time you key up.

Gord

From: ron_thumann@sbcglobal.net
Topic: 37033 Message: 37033

I'm trying to hook up my UV-5R+ to an old Kantronics Packet Communicator 3. If I solder the cable as shown below, the radio transmits as soon as the cable is plugged into the radio and KPC3. I'm guessing that my wiring (PPT?) is incorrect. FYI: I've tried different settings for the HT jumper on the KPC3 board but that did not help.

2.5mm: sleeve to DB9-pin 6, tip to DB9-pin 5
3.5mm: sleeve to DB9-pin 3, ring to DB9-pin 1

It's been a few years since I've messed around with packet so thanks in advance for your help.

I can tell you about the problem, but I don't have a clue about a solution.

The difficulty is how the radio handles PTT -- by connecting the sleeve of the two plugs together! There is no simple place to connect a single line for PTT.

If you can find instructions for wiring your KPC3 to any current Kenwood HT, that should work; I did a quick search online and found lots of documentation for connecting the KPC3 to various Kenwood mobiles, but nothing on connecting it to any Kenwood HT.

My GUESS would be that you might need to wire the KPC3 PTT circuit to a relay and have the relay connect the two sleeves for PTT.

Ed,

You are MOSTLY right, but don't fall into the trap of thinking that the same rules apply everywhere.

Also don't fall into a couple of other traps that seem to be quite common, such as:

- Assuming that any radio capable of transmitting on amateur frequencies and used by an amateur is automatically an "amateur radio"
and
- Assuming that any "amateur radio" is automatically legal even in a country that doesn't require equipment approval for "amateur radio" equipment.

Regulations in most of the industrial and developed countries do give licensed amateur radio operators far more freedom concerning their equipment than is allowed for other radio services. But many countries do limit this freedom to equipment for use on authorized amateur radio frequencies, especially at VHF and UHF which are often regulated very differently from HF.

Have you ever wondered why nearly all modern amateur radio equipment comes designed to transmit ONLY on amateur frequencies (even though the "mod" for out-of-band transmission is generally pretty easy) and why there are almost always at least two versions of each radio, one for the US (and other Region 2 countries) and one for "Europe" (Region 1 countries). For example, compare the Kenwood V71A and V71E (where A stands for Americas, and E stands for Europe)
V71A - Frequency Coverage: 144-148 and 430-450 MHz TX, 118-524 and 800-1300 MHz (Excluding Cellular) RX
V71E - Frequency Coverage: 144-146 and 430-440 MHz TX, 118-524 and 800-1000 MHz RX

There are a few countries that regulate receivers (including the United States), but nearly every country carefully regulates radio transmitters. And most of the time, regulations about transmitters are based on which frequencies the radio is capable of transmitting.

From: Ed Plaisance

Excellent.

I think we should be seeing a pattern here because there is a pattern here.

Like the Mythbusters on TV, hopefully some of these myths will disappear, for a while at least. Like urban legends, they keep coming back.

If only everyone could see the simple dichotomy: the two-way radio world is basically AMATEUR and NON-AMATEUR.

Non-amateurs (business/emergency/personal/private/whatever) can only operate specific equipment which has been approved by the government for their purposes. This equipment is labeled as such by the manufacturers. (Baofeng UV-5R: Part 90 in the USA, for example) Licenses, where required, are issued to entities/persons based on the knowledge that the authorized equipment will perform as required for that purpose.

It is interesting that both Canada and Australia share a requirement for the lowest level of amateur rating "... restricted to the use of commercial radio equipment that has been specifically designed for use within the Amateur Radio Service."

This would preclude homebrew transmitters for them at that level, it seems.

Here in the UK we just invite those types to an eyeball. When they get there most often there is a big bunch of repeater users waiting to see them. In London that's a lot of cabbies and white van men. Then we make them a reasonable offer for their gear. If that dosent apply we just throw it all in the river Thames and be done with it. They normally only have old hand held anyway and the cabbies make loads of money.

Bummer. I didn't mean the last post to end up here. I was saying what we do to illicit repeater users . Ham radio being largely self policing in the uk. Sorry if it looks like im condoning confiscating questionable gear from users. Which i am not..

You mean to say that down under you cant have say an ex fire brigade radio on 2 meters ? Or do something like re eprom an old police mobile to cover all of 70cms. Here in the UK that is the main way of getting on 4 meters FM. In fact i think that its the only way, with the Woxun being about the only smallish 4m rig available commercially.

It used to be that we needed a special permit to covert a multimode cb to a ten meter rig. But that was dropped years ago now. And most 10 meter rigs in Europe do 11 as well. I was listening to a qso on 40 this evening and the old hams were talking about meeting up on 27 ssb tomorrow, and then when all were in the net qsy over to 40m !!!

You've got it . Red hot means to hot or just very hot indeed. Like if a sausage falls out of the pan and you cant pick it up with your fingers you can say. " I couldn't pick it up because it was red hot" . A Londoner is most likely to speak in this way if talking about hot things in general. For example something like Nihari, or Chilli, or Vindaloo Curry can be " Red Hot" if someone wants to say that they don't think they can eat stuff like that.

But my programming cable was very hot. And so hot that it was starting to smell. When i took it apart the board was to hot to comfortable touch with my fingers.

This radio should work fine with the old Baycom kit modem. And as there is no mechanical relay it might be able to run all day for plenty of days. The relays jsut used to oxidise and jam up on the older rigs.

Subject: [baofeng_uv5r] Kantronics Packet cable

I'm trying to hook up my UV-5R+ to an old Kantronics Packet Communicator 3. If I solder the cable as shown below, the radio transmits as soon as the cable is plugged into the radio and KPC3. I'm guessing that my wiring (PPT?) is incorrect. FYI: I've tried different settings for the HT jumper on the KPC3 board but that did not help.

2.5mm: sleeve to DB9-pin 6, tip to DB9-pin 5
3.5mm: sleeve to DB9-pin 3, ring to DB9-pin 1

It's been a few years since I've messed around with packet so thanks in advance for your help.

Xuan,

Yes, exactly.

I wanted to keep my "exposition" limited so that it could be easily absorbed yet not be a source of misguidance, at least not within a given jurisdiction.

If all this research shows nothing else, it shows that there /are /differences from one country to the next regarding what is permitted in amateur radio.

And if my short experience in this user group shows me anything, this issue will reappear with every rising moon.

The legislation covering Australian Foundation Licences states

"
28 Transmitting equipment restrictions

The licensee must not operate an amateur foundation station using a transmitter that has not been manufactured commercially."

The Australian Government web site with this determination is found here
http://www.comlaw.gov.au/Details/F2013C00061/Html/Text#_Toc347310709
http://www.comlaw.gov.au/Details/F2013C00061/Html/Text#_Toc347310709

Note it does not state "specifically designed for use within the Amateur Radio Service"

G.

Amateurs are licensed by their governments and can operate any kind of equipment that meets the general requirements for transmitting, but they can only operate on designated frequencies with specified power limits and any other defined restrictions.

Non-amateurs (business/emergency/personal/private/whatever) can only operate specific equipment which has been approved by the government for their purposes. This equipment is labeled as such by the manufacturers. (Baofeng UV-5R: Part 90 in the USA, for example) Licenses, where required, are issued to entities/persons based on the knowledge that the authorized equipment will perform as required for that purpose.

It is interesting that both Canada and Australia share a requirement for the lowest level of amateur rating "... restricted to the use of commercial radio equipment that has been specifically designed for use within the Amateur Radio Service."

This would preclude homebrew transmitters for them at that level, it seems.

It was initially proposed when the UK took on a three teir licence system that foundation licence holders would not be allowed to build and use homebrew gear. But i think that was dropped. Novice licence holders however are and were always encouraged to homebre and most manuals for novices that have been produced by the RSGB are structured heavily around the novice (or now intermediate) building their own kit Everything up from the rig to the atu and the aerial. The only thing the novice is supposed to really but is his swr meter and his multimeter.

It musty be noted that a very large part of the British domestic ham radio market producers are now kit producers exclusively. There were company's such as Garex who built radios but they have largely folded in the current economic climate. Manufacturers like Lowe and Eddystone were the first to go. If nobody were to buy and build kits it would all go in a few years. Well, i suppose it has done..

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

Ed,

You are MOSTLY right, but don’t fall into the trap of thinking that the same rules apply everywhere.

Also don’t fall into a couple of other traps that seem to be quite common, such as:

- Assuming that any radio capable of transmitting on amateur frequencies and used by an amateur is automatically an “amateur radio”
and
- Assuming that any “amateur radio” is automatically legal even in a country that doesn’t require equipment approval for “amateur radio” equipment.

Regulations in most of the industrial and developed countries do give licensed amateur radio operators far more freedom concerning their equipment than is allowed for other radio services. But many countries do limit this freedom to equipment for use on authorized amateur radio frequencies, especially at VHF and UHF which are often regulated very differently from HF.

Have you ever wondered why nearly all modern amateur radio equipment comes designed to transmit ONLY on amateur frequencies (even though the “mod” for out-of-band transmission is generally pretty easy) and why there are almost always at least two versions of each radio, one for the US (and other Region 2 countries) and one for “Europe” (Region 1 countries). For example, compare the Kenwood V71A and V71E (where A stands for Americas, and E stands for Europe)
V71A - Frequency Coverage: 144-148 and 430-450 MHz TX, 118-524 and 800-1300 MHz (Excluding Cellular) RX
V71E - Frequency Coverage: 144-146 and 430-440 MHz TX, 118-524 and 800-1000 MHz RX

There are a few countries that regulate receivers (including the United States), but nearly every country carefully regulates radio transmitters. And most of the time, regulations about transmitters are based on which frequencies the radio is capable of transmitting.

From: Ed Plaisance mailto:plaisaeb@...

Excellent.

I think we should be seeing a pattern here because there is a pattern here.

Like the Mythbusters on TV, hopefully some of these myths will disappear, for a while at least. Like urban legends, they keep coming back.

If only everyone could see the simple dichotomy: the two-way radio world is basically AMATEUR and NON-AMATEUR.

Amateurs are licensed by their governments and can operate any kind of equipment that meets the general requirements for transmitting, but they can only operate on designated frequencies with specified power limits and any other defined restrictions.

Non-amateurs (business/emergency/personal/private/whatever) can only operate specific equipment which has been approved by the government for their purposes. This equipment is labeled as such by the manufacturers. (Baofeng UV-5R: Part 90 in the USA, for example) Licenses, where required, are issued to entities/persons based on the knowledge that the authorized equipment will perform as required for that purpose.

It is interesting that both Canada and Australia share a requirement for the lowest level of amateur rating "... restricted to the use of commercial radio equipment that has been specifically designed for use within the Amateur Radio Service."

This would preclude homebrew transmitters for them at that level, it seems.

Point taken...the wording, while similar in intent, I believe, is not
the same.

How thrilling to see that some people are actually reading these documents.

The thrust of my comment was that both Canada and Australia require the
lowest level of amateur rating to use a transmitter that is
"commercially manufactured"...the traditional American "homebrew" would
not be allowed for this amateur rating in Canada or Australia.

I recently won the latest version UVB5 for silly money on ebay. Its cost me about £19.00 with postage. So i am happy. But when i started bidding i took a look at the Chinese retailer that i was bidding to. And yes they had a mobile. But they are single band. One is for 70 and the other is for 2. Cost for UK customers is about £120 inc of postage. This must be good since both rigs are fully featured and with DTMF mics. Its about 50 watts output for the 144 and 70 watts for the 433.

I cant remember much else. But here in GB that would just about slaughter the competition from Yeasu and Icom. When this happens most of the time the UK dealers will procure stocks of these radios and sell them at a price typically 40 % higher than say a Chinese dealer like 409 shop.

Most UK dealers were dead in the water on on the bottom of the river like steamboat willy years ago. Those that exist are mainly Icom franchised. When i last bought a part from a UK dealer i got two separate invoices come to me in the post. One from Icom and the other from the retailer trading name.

Icom is in the lead here in the UK at the moment as they hve something expensive and silly called D STAR. This was a successful poison dart in reply to Yeasu,s echolink. Which i prefer to use.

---In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

All of the Chinese companies are related- some have the same Communist Party oversight and leadership structures and policies come from the same people. Many are parent companies and operate factories under various names.

Slightly different from our countries operating procedure. In the old days they would just use “factory 54” “factory 26” Now they change the names of the old pre-capitalist factories to something different but actually they are related.

So when you see Baofeng, the same company in another location would be Zastone or Baojie but still related to the same group leadership (marching orders come from the same people)

Baojie and Zastone make car mobiles and the look very similar and even more similar to Yaesu versions. Check some of them out as these are related companies.

I am not sure if Baofeng name will be on one of these units in the future or not. Same units just different names (as my example same product but marked factory 56 or factory 26 in the old days)

You do not get anything done in China unless the Party membership says so with them or their families/friends/relatives getting a piece of the pie.

It is also rumored these radios are being produced at or below costs subsidized by the Chinese government to challenge or ruin the previous Japanese controlled radio market.

With that in mind, under $200 dollar mobiles with the same abilities as a $400 model are starting to make their debut. The problem with them taking over the market is poor manuals, programming software and slight QA problems. I think very soon these issues will be fixed with many reporting the AnyTone and PowerWerx mobiles as decent testing the water contenders.

Another worthy model is the Zastone MP900 version.

Does anyone in the group have one of these? I purchased one from Radio-Mart. It is one where the AX is in magic marker and the UHF freq listing on the back of the radio blacked out.

I cannot enter 220 Mhz frequencies manually or via software. When manually entering freqs, the radio says cancel when the last digit is entered. When using the software, it errors that the frequency is out of the received range.

I can tell it is transmitting on the 220 Mhz frequencies that were programmed into it prior to it being shipped.

Radio-Mart said there is a specific software that will work with the 220 range and is working on getting me the link.

Does anyone have a link to the proper software and has had success in programming that can help me?

I have recently imported and programed a Baojie BJ-9900 dual band
mobile. It looks and acts much like a Yaesu 8800, I'm told.

Overall, I was quite impressed with the radio, especially at USD250,
despite having read some less than flattering reviews beforehand. I
think like many Chinese radios, early examples may have had quality issues.

Makiing an announcement tht tthere is some one using the repeater illegally with out a licence and to explain how one gets a licence and who to contact is not communicating with a third party. any one can listen to you as you ragchew already. if that was illegal we would all be in jail for comunicating with third party’s as they listened. its not aginst the law to listen with any kind of equipment on any freq.

Do you think that sites like e bay may be server dependant as to what is accessible to the user ? For example if i told you there were Baofeng bargains to be had on the e bay retailer NextBigThink as i can see here in the UK. Or even the Chinese dealer 409 shop, then perhaps if you try to access these sites from where ever you may be you could perhaps see different listing or simply get no access to the pages ?

I had seen the dual band Chinese Radios and the price was the same. I also believe that one famous UK dealer has tried to beat ff the flames by offering them on his pages in Ham Radio Today magazine. This would have been last year though.

When the UVR3 came on the scene one uk retailer was sending them out as bonus items to all orders over £250. This must be a ploy to lower the status of the product and make it look like a goody bag item.

---In baofeng_uv5r@yahoogroups.com, <wrmaxwell@...> wrote:

I have recently imported and programed a Baojie BJ-9900 dual band mobile. It looks and acts much like a Yaesu 8800, I'm told.

Overall, I was quite impressed with the radio, especially at USD250, despite having read some less than flattering reviews beforehand. I think like many Chinese radios, early examples may have had quality issues.

Bill, VK7MX
On 27/11/2013 10:30 AM, steven_o@... mailto:steven_o@... wrote:

I recently won the latest version UVB5 for silly money on ebay. Its cost me about £19.00 with postage. So i am happy. But when i started bidding i took a look at the Chinese retailer that i was bidding to. And yes they had a mobile. But they are single band. One is for 70 and the other is for 2. Cost for UK customers is about £120 inc of postage. This must be good since both rigs are fully featured and with DTMF mics. Its about 50 watts output for the 144 and 70 watts for the 433.

I cant remember much else. But here in GB that would just about slaughter the competition from Yeasu and Icom. When this happens most of the time the UK dealers will procure stocks of these radios and sell them at a price typically 40 % higher than say a Chinese dealer like 409 shop.

Most UK dealers were dead in the water on on the bottom of the river like steamboat willy years ago. Those that exist are mainly Icom franchised. When i last bought a part from a UK dealer i got two separate invoices come to me in the post. One from Icom and the other from the retailer trading name.

Icom is in the lead here in the UK at the moment as they hve something expensive and silly called D STAR. This was a successful poison dart in reply to Yeasu,s echolink. Which i prefer to use.

---In baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com, <doopsnoop@...> mailto:doopsnoop@... wrote:

All of the Chinese companies are related- some have the same Communist Party oversight and leadership structures and policies come from the same people. Many are parent companies and operate factories under various names.

Slightly different from our countries operating procedure. In the old days they would just use “factory 54” “factory 26” Now they change the names of the old pre-capitalist factories to something different but actually they are related.

So when you see Baofeng, the same company in another location would be Zastone or Baojie but still related to the same group leadership (marching orders come from the same people)

Baojie and Zastone make car mobiles and the look very similar and even more similar to Yaesu versions. Check some of them out as these are related companies.

I am not sure if Baofeng name will be on one of these units in the future or not. Same units just different names (as my example same product but marked factory 56 or factory 26 in the old days)

You do not get anything done in China unless the Party membership says so with them or their families/friends/relatives getting a piece of the pie.

It is also rumored these radios are being produced at or below costs subsidized by the Chinese government to challenge or ruin the previous Japanese controlled radio market.

With that in mind, under $200 dollar mobiles with the same abilities as a $400 model are starting to make their debut. The problem with them taking over the market is poor manuals, programming software and slight QA problems. I think very soon these issues will be fixed with many reporting the AnyTone and PowerWerx mobiles as decent testing the water contenders.

Another worthy model is the Zastone MP900 version.

CHIRP will not work on this one. Radio-Mart says that only the special software they have will work. I received it and it appears to be a modified version of the factory software. out It also does not work, same errors about being out of the frequency range.

I went with Radio-Mart's 220 Baofeng as I have 2 UV-5Rs and my accessories are compatible.

I suppose I really do not need a 220 radio anyway. I got a free 200 Ringo and thought why not.

Gary

The Baojie BJ9900 uses dual conversion 38.55MHZ/450KHz on the right hand
receiver, 49.95MHz/450 KHz on the left, according to the manual.

37074. Re: [baofeng_uv5r] Digest Number 2650

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-27 11:35:32 UTC
From: Gary Nachman
Topic: 37074 Message: 37074

The latest Daily Build of Chirp does not work. It can download from the radio. It can import from sources. It will not allow me to insert 224.86 which is a local repeater. I get "Error setting memory: Frequency 224.860000 is out of supported range"
Upload to Radio is greyed and not enabled.
Again, on this radio, the 440 frequency rand notation on the back of the radio under the battery is blacked out with magic marker. The "AX" designation on the box is magic marker.
Radio is going back.
And I checked the FCC ULS database, Martyn, K4TEC is a legit General Class Amateur Radio Licence.

I have this radio and used CHIRP with no problems. I imported my 220
channels from Repeater book using the CHIRP function.

I used the software from RT systems. It programs the 220 MHZ. Baofeng.
You must also buy there cable. It is much better software than CHRIP.

Radio Mart had them specially made for them from a factory order. The only source for these

will come from radio-mart, however I think the uv5R based version is either sold out or very limited in supply. The new switch over to the Uv82 version which radio-mart also carries as their new 220 mhz version. I have both , bought from Radio-Mart with No issues and they both programmed very easily with Chirp.

Jim, is right both versions the RAX and the latest 220 UV82 both program with Zero problems using Chirp. So it is possible another issue is at play causing them not to program. I can even read from my ZT-2R clone of the Yaesu VX2R using Chirp. If anyone has a ZT2R what is the secret to get it to write to the radio?

I am sure this is also some operator error as the read works no problem.

That's the same as the U.S., except here it's called a "B & O Tax".

Yes, we are. Capital letters has been considered yelling for decades (I've been on the 'net
since the eighties). It's the same as if a ham was using a repeater "improperly&qu ot;
except no one can ban you. This has been mentioned before. It will said again by some one
until you get the idea. Sorry.

Bob

The latest Daily Build of Chirp does not work. It can download from the radio. It can import from sources. I can input 220 Mhz frequencies into the software. I cannot upload to radio as it is grayed out and not enabled. If I try to input frequencies into the downloaded image, I get "Error setting memory: "Frequency 224.860000 is out of supported range"
Radio is going back.
Again, on this radio, the 440 frequency band notation on the back of the radio under the battery is blacked out with magic marker. The "AX" designation on the box is magic marker.
And I checked the FCC ULS database, Martyn, K4TEC is a legit General Class Amateur Radio Licence.
I just do not believe that these radios are a special run, but a handyman's mod with an unstable 220 MHz erratic capability.

Does anyone in the group have one of these? I purchased one from Radio-Mart. It is one where the AX is in magic marker and the UHF freq listing on the back of the radio blacked out.

I cannot enter 220 Mhz frequencies manually or via software. When manually entering freqs, the radio says cancel when the last digit is entered. When using the software, it errors that the frequency is out of the received range.

I can tell it is transmitting on the 220 Mhz frequencies that were programmed into it prior to it being shipped.

Radio-Mart said there is a specific software that will work with the 220 range and is working on getting me the link.

Does anyone have a link to the proper software and has had success in programming that can help me?

There is a setting in CHIRP for the supported range. It needs to be set correctly for your radio.
Bruce W. - KV4OE
==========

----- Original Message -----
From: "Gary Nachman"

The latest Daily Build of Chirp does not work. It can download from the radio. It can import from sources. It will not allow me to insert 224.86 which is a local repeater. I get "Error setting memory: Frequency 224.860000 is out of supported range"
Upload to Radio is greyed and not enabled.
Again, on this radio, the 440 frequency rand notation on the back of the radio under the battery is blacked out with magic marker. The "AX" designation on the box is magic marker.
Radio is going back.
And I checked the FCC ULS database, Martyn, K4TEC is a legit General Class Amateur Radio Licence.
Gary - KF9RM

Gary,

Before you send it back, I would appreciate it if you would send me a CHIRP .img file saved from the radio in its current state and another .img file after a menu 40 (RESET).

37078. Chirp 0.3.1 Linux install

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-27 13:09:59 UTC
From: <steve.morton@...>
Topic: 37078 Message: 37078

Sorry if this has been answered before. I'm trying to install the Linux version of Chirp, version 0.3.1 on a Linux machine just using the command:

sudo apt-get install chirp

The command works fine it downloads and installs ok. But when I start the application in Ubuntu 12.04 I find the version is in fact 0.1.12 which is in the daily builds I think?

I removed the software and tried again but each time I end up with the same version which doesn't appear to support the UV-5R+

Any clues would be very welcome.
Thanks
Steve G8SFR

TJ3Sat is the first satellite built by high school students. It will be functional for the next 6 months. It has a Ham radio component to its mission. Check the link below. At the appropriate time I was able to hear the beacon on 437.320 MHz. Very cool.

I believe that is a very, very old stable verison.

You'll have to install the repository as shown on the "Running CHIRP Under
Linux" page.

http://chirp.danplanet.com/projects/chirp/wiki/Running_Under_Linux

sudo apt-add-repository ppa:ubuntu-hams-updates/ppa
sudo apt-get update
sudo apt-get install chirp

Since you have a UV-5R, I would recommend that you install a daily build.
There has been quite a lot of activity for the UV-5R and its variants since
the v0.3.1 stable was released last April. Install that repository as shown
on the CHIRP download page.

http://chirp.danplanet.com/projects/chirp/wiki/Download

sudo apt-add-repository ppa:dansmith/chirp-snapshots
sudo apt-get update
sudo apt-get install chirp-daily

In any case, I would suggest that you install both repositories. You'll
still be able to pick which version you want to install.

Gary

Each RAX is fully tested before being sent out with no exceptions

If the box has RAX on the outside then you have the correct model and you told me on the phone that you have 220MHz displayed

I sent you twice the software direct, it is a RAR file and I sent you a link to winrar so you could download the free software to extract it and use it.

If the radio has a problem I am more than happy to exchange it but I will say this will be the first and only one we would have received back.

Re your public comments "Time for a refund request or PayPal dispute if not remedied" I have answered all of your questions and have worked with you and have not denied you a refund or exchange, I can't do anything other than that

Happy Thanksgiving Gary

Pete,
This is a long shot, but older firmware versions of the VHF/UHF radios required you to set the correct band first. The newer firmware versions do this automatically based on the first digit entered (1 = VHF, 4 or 5 = UHF). This may not work for a VHF/220 radio. So try setting the band to UHF using the band button. If you have not band button, use menu 33 (BAND).

Hello all,

Just curious, other than case changes, are the different UV-5* models just firmware updates?

Felt stupid after receiving my UV-5RA and then seeing that the newest was the BF-F8+, it think it would've been more trouble to exchange it than what it's worth...mine was $31 shipped, so I can't really complain.

But still I would've preferred it to be the newest.

No. Just case changes. They all have whatever the latest firmware was at
the time they were built.

>
> Felt stupid after receiving my UV-5RA and then seeing that the newest was

Who says the BF-F8+ is the newest? It is just another UV-5R in a different
case.

>
> But still I would've preferred it to be the newest.

The firmware version determines if you radio is the newest. Not the case or
letters printed on badge.

There have been no user noticeable changes in any firmware release since
BFB295. So if you press and hold the [3] key while you turn on your radio
and it displays BFB297, you are good.

Hmmm... that’s not entirely true.

The local repeater group did install such a monitoring device, it was shown to be able to identify incoming signals.
The intended purpose was to identify people who had a problem with behaving nicely with their fellow beings in the area.
Don’t know what came of the effort, though. It was attempted at least ten years ago.

Stan

I can never find that "Like post" button when I need it.

****

I believe this question, along with many others, has been asked numerous times. That is why somebody was kind enough to make FAQs readily available to anybody who wanted to take 2 minutes to help themselves first-find out if the question was referenced there first, THEN ask the group. People who refuse to do a little researcher on their own first are showing disrespect to the folks who went through all the trouble of trying to save us trouble by making the references so easy to get to. Check the bottom of each and every email sent through this group. You would be amazed at how many questions would be answered there.

Just my two cents worth. (I know I have change coming).

What model Baofeng uv-5? would you purchase?

Other than 'looks' any advantage/disadvantages one model over the other?

Thanks!

There are now extended batteries and AA-cell cases that are for the UV-5RA (and similar) case style. I would expect that they would not fit the original UV-5R (or at least not without modification to the battery/case and/or radio.

I also noticed that some vendors on eBay claim that their extended batteries and AA-cell cases are for the "UV-5R, UV5RA, UV-5RB, UV-5RC, UV-5RD and UV-5RE". I would be vary wary of these vendors. I don't think it is possible to make a universal version of these items that would fit all of these case styles.

I also noticed that the package version of Chirp (and fldigi) is a bit
stale. I suggest compiling it to get whatever specific version you may
need. Usually, it's a simple process (untar, ./configure, make, make
install), but sometimes you may need additional libraries, development
kits - or even a working compiler.

Issue resolved. The Radio is working fine on 220 repeaters.

Jim, KC9HI had me send him a "stock, as shipped" image from the radio and then an image of the radio after performing a "Menu 40 Reset All".

Long story short, the Chirp software looks at a setting in the radio to determine if it is a VHF/UHF radio or a VHF/220 radio. The file image from my radio as it shipped from the factory was configured as such that it was detected by CHIRP (and likely the Baofeng software) as being from a VHF/UHF radio. The image file from the radio after it was "reset" then had that byte properly set and was be detected by CHIRP (and the Baofeng software) as being from a VHF/220 radio.

Sp post reset, the radio works with CHIRP, the standard Baofeng Software as well as the version Radio-Mart had sent me.

I have read on the web that there are those that had similar issues and felt their radios were now relegated to becoming a paperweight. A simple Reset All would likely remedy.

So I am pleased with the purchase and do own Martyn an apology as stating a refund or if need be, a dispute is my next step if necessary was a bit harsh as I have no reason to believe Martyn and Radio-Mart is anything but an upstanding merchant who would stand behind his merchandise and provide a refund if in fact, the issue could not be resolved.

So I would not hesitate to recommend one of these radios to anyone looking for an inexpensive 220 HT that may use other Baofeng accessories that they may already own. If an issue similar to mine arises, just go to Menu 40 and "Reset All.

I was just using the UV5r with a Nagoya NA-771 antenna. I did listen to the audio clips on the website so I would know what I was listening for. I used the tracking link on the site to know when the sat was passing overhead and went out on my deck and pointed the antenna in the general direction of SSW and heard it,

Ok, so now I'm curious. Since when did Yaesu develop EchoLink? I know
their radios can be used with the EchoLink system, but that's hardly the
same amount of development as Icom with D-Star.

I think the op meant WIRES which works with EchoLink.

_____
From: Craig Carnahan <craig.n7lb@...>

Ok, so now I'm curious. Since when did Yaesu develop EchoLink? I know their radios can be used with the EchoLink system, but that's hardly the same amount of development as Icom with D-Star.

You may be correct. Not against Yaesu's "WIRES", but they have a very long way to go to catch up with the number of D-Star repeaters available world-wide. Personally, I think it was silly of Yaesu to not support D-Star in some fashion (and thereby sell many more radios).

I'm glad that some of you have had a good experience with RadioMart, sadly that was NOT my experience when he was still allowed to sell products on Amazon. I agree with others, I wish I had googled him and the company before my purchase.

My group wanted some 2m/220 radios a while back, but we decided not to chance another issue with RadioMart and purchased several Wouxun units instead. Paid a bit more, but sometimes money isn't everything.

Until rather recently the only way to support D-Star required a rather large payment to Icom – and for all Icom’s jabbering to the contrary, D-Star remains basically a proprietary system.

And, the simple fact is that D-Star is still supported in a relatively small number of places, almost all of which are large metropolitan areas.

From: Craig Carnahan

I too had a good experience with Radio Mart.

All retailers can't make everyone happy all the time and problems do occur.

If I were a fellow Ham retailer, I certainly wouldn't publicly bash a competitor...especially online where you can't remove your commentary as this might cause people to not only avoid the bashed competitor, but more importantly you reveal your own crass behavior driving business away from your own retail outlet before they have a chance to experience your jerky service.

Issue resolved. The Radio is working fine on 220 repeaters.

Jim, KC9HI had me send him a "stock, as shipped" image from the radio and then an image of the radio after performing a "Menu 40 Reset All".

Long story short, the Chirp software looks at a setting in the radio to determine if it is a VHF/UHF radio or a VHF/220 radio. The file image from my radio as it shipped from the factory was configured as such that it was detected by CHIRP (and likely the Baofeng software) as being from a VHF/UHF radio. The image file from the radio after it was "reset" then had that byte properly set and was be detected by CHIRP (and the Baofeng software) as being from a VHF/220 radio.

Sp post reset , the radio works with CHIRP, the standard Baofeng Software as well as the version Radio-Mart had sent me.

I have read on the web that there are those that had similar issues and felt their radios were now relegated to becoming a paperweight. A simple Reset All would likely remedy.

So I am pleased with the purchase and do own Martyn an apology as stating a refund or if need be, a dispute is my next step if necessary was a bit harsh as I have no reason to believe Martyn and Radio-Mart is anything but an upstanding merchant who would stand behind his merchandise and provide a refund if in fact, the issue could not be resolved.

So I would not hesitate to recommend one of these radios to anyone looking for an inexpensive 220 HT that may use other Baofeng accessories that they may already own. If an issue similar to mine arises, just go to Menu 40 and "Reset All.

Au contraire, Xuan.

D-Star is in fact, not a proprietary design developed by Icom, but rather it was designed by the Japan Amateur Radio League by hams for hams. It is true that to date, only Icom has developed multiple radios (HT's, Mobile's, and Base Station's) and multiple repeater's for use with D-Star, but nothing stops Alinco, Baofeng, Kenwood, Wouxun, Yaesu, etc., etc. from also supporting JARL's D-Star protocol's except pride. It has long been rumored that Kenwood does support a D-Star option, but only in Japan.

What confuses many folks are D-Star is two different issues, one being the CODEC that Icom uses in their products, and two is that most folks looked at D-Star in it's early stages, made up their minds one way or another, and stopped looking at all the new developments since. A current Icom D-31A radio, for example, is far easier to get setup on D-Star today than any first generation stuff from Icom, as you would expect since Icom continues to add functionally and ease of use to D-Star.

I'm not knocking those folks that can afford APCO 25 commercial rigs, and have the ability to get them re-programmed for Amateur use, but forget about field programming most APCO 25 radios unless you have a cable and laptop handy. I'm also not knocking WIRES from Yaesu from a technology standpoint. Both have benefits, but if you think D-Star has a limited amount of repeaters online, don't even think about MotoTurbo or WIRES, their numbers are tiny in comparision, and of course D-Star's numbers are tiny compared to analog repeaters worldwide.

JARL didn't development a digital protocol with one single manufacturer in mind, so I still think it's a shame that the rest of the industry (that wants to sell a digital radio to hams), doesn't develop a standard around the closest thing to an open protocol for hams that's currently shipping (JARL's D-Star), especially when it has such a large head start with repeaters all over the globe (and based on Icom's current promo for repeater owners, more to come for sure).

Another way to put it. Gee, did you build your first computer by soldering the parts on the circuit board? (I did and still have it.) Also remember the first HTs were old Motorola units that were modified for the ham bands, now we have these cheap, easy to program UVs. Times change. :) (Also a way of singing back to the proper discussion)

Bought a couple of UV54s a couple of weeks ago. Got my Technician ticket today. Got the radios all programmed up via Chirp, hitting all the local repeaters just fine.

I have a question on the display. In Channel mode, the pre programmed repeater call sign only shows in the top line of the display. The freq of the other channel shows up in the bottom line. I can't get the call signs on the lower line. Is this a feature, or do I have to change something in the programming? I read through the Milkor manual and nothing jumps out at me.

Thanks

In programming, you can set each line (top and bottom) to display either the frequency, or the name, but not both. Keep in mind, all of the memory channels are the same, whether you are looking at the frequency display or the name display - the little number to the right is the channel number. Set the other display to that channel and you will see the other display. Many people, myself included, like it set up this way so you can easily reference a memory channel by either method.

If you used CHIRP, In Settings > Basic Settings, you need to set Display Mode (B), which is the lower line on the radio's display, to NAME.

Or, manually, press Menu, 22, Menu, then use ^ or v buttons to select NAME, press Menu again to save the selection, and press Exit.

Bill,

I agree that you can't make everyone happy, but as a merchant, I think your chances of being known for superb customer service (like Kurt at Three Old Crows is known for) are greatly diminished when you choose to ignore common good business practices and don't fess up when mistakes (giving RM the benefit of the doubt) are made.

As I said before, glad your experience was good, others online (myself included), not so much. Google past history on the company if you want to learn more, if not, that's OK too. My lesson with RM was learned the hard way, so as the Roman's used to say, Caveat Emptor.

Old video and news story that's been seen before.

What I'm waiting for is the update to the story that tells us what happened (if anything) to the folks involved (kids or parents) or what steps the EMS folks have done to prevent the problem from occurring again.

My personal bet is that Motorola is trying to sell the EMS folks loads of new digital gear on different bands, but that's just my guess.

You may need to change the step rate and even then you may need to use up
or down arrow buttons to step to the desired frequency.

Here is a recent one. Former Ham,too. ex K1MBE

Mark C. Curran Jr. Sheriff Raymond J. Rose Undersheriff

MEDIA RELEASE Lake County Sheriff's Office • 25 South Martin Luther King, Jr., Avenue• Waukegan, Illinois 60085
For Immediate Release Date: November 27, 2013
Contact: Sergeant Sara Balmes Office: (847) 377-4254 Mobile: (847) 309-4259 Fax: (847) 360-5796 E-Mail: sbalmes@lakecountyil.gov

Waukegan man charged for racially offensive radio transmissions On November 26, 2013 Raymond J. Kelly, 24, of the 4800 Block of Eastwood Ct in Waukegan was arrested after tampering with jail communications. During the evening hours of November 23, 2013 and November 24, 2013

Kelly, an avid amateur radio operator, gained access to the Lake County Sheriff's Office corrections talk group and transmitted racially offensive language. Kelly is a former police and fire explorer. He was previously arrested and charged by Kenosha County Sheriff's Office in a similar incident.

A search of Kelly's residence resulted in the seizure of radio and other electronic equipment. Kelly has been charged with Tampering with Communication Services (2 counts) and Harassment through Electronic Communications. His jail bond is set at $10,000.00. He is scheduled to appear in court on December 5, 2013. The case has been referred to the FBI. The Lake County Sheriff's Office has implemented measures to prevent a future security breach.

End of Release.
Sgt Balmes

The simple fact exists, it was available some years back, know of one instance where it was installed for a while and then was very quietly removed and forgotten. Just the memory of its having been there was then used as a deterrent to the foolish acts of some people. Kind 'a like the Wouf Hong.

The one big block to its use was that you had to record each radio's "fingerprint" while the person was using it, just talk to friends... with a call sign.
That required that someone would have to be monitoring the repeater 24/7/365 in order to build up a usable database. Or, have a long term tape recorder running in synch with the data gatherer so you could catch call signs or recognize voices. Remember, this was like fifteen years ago. Terabit drives were only used by the NSA.

You might find some folks... the usual ones who had "nothing to hide", who would actually allow you to fingerprint their equipment. But, would you figure that the bad guy would go along with that request? And of course, there are some of us who would find such a request to be defamatory and intrusive.

The recorder would tap into the discriminator's (the circuit that recovers audio data from the incoming FM signal) dc coupled output, and record everything, even down to how far off frequency the incoming signal was. How? Easy, discriminators provide a dc offset either plus or minus depending upon the resting frequency of the received signal... There were some older (ancient) rigs who had a tuning meter that looked at that value as an aid to setting your receiver exactly on channel.

But, the crystal drift of all the repeater's receive oscillators (both first AND second conversion) had to be zero, or that data would be compromised. You could still record the time variable data, e.g.. how long it took for the transmitter's signal to settle down and how stable it was, any background hums, the exact amplitude of the PL tone and any distortion in it. I'm probably missing a few other bits, but you get the idea.

With today's digital storage capabilities, it might actually be more friendly, but back then, it was a chore to use.

Probably not….he's had his tech license for at least 5 years….which was canceled 9/20/13 and address change done on 9/18/13 (hmmm) before this incident occurred.

So probably an older HT. Then again…if the confiscated his equipment he may have bought one….or had another HT hidden somewhere…

http://wireless2.fcc.gov/UlsApp/UlsSearch/license.jsp?licKey=3014337

Plus this wasn't his first time either and says he was using a Harris unit before:

http://www.mcwa.org/jun_13_minutes.htm

Repeater: Cornell, KK9DX says the jamming is still going on. Both of them were on to-night.. both of them are Hams. He told Kc9ona he was coming to his driveway in two minutes so that person quit and the other jammer started up.
The other alleged jammer is K1MBE believed to be using a Harris handi talkie and staying right near the repeater's antenna.
K1MBE was caught by Kenosha county police and confessed to jamming Lake County repeaters and police communications as well.

Not too many secrets in today's internet age….

Mike W9MDB

Why does it really matter? All caps, all lower case, misspelled, if o can read it, I don't complain. If I can't, I'll ask for a clarification. Many hams have physical disabilities and feel proud to be able to communicate by computer. Worrying about case type, fonts, etc.., are a concern they don't need to hear. Same goes for spelling. Besides I am sure most of us can figure out quickly if the writer is mad and shouting, or not.

Thanks. After about an hour and an email from a friend I got the menu sorted out.

It's funny; I have successfully programmed digital variable frequency drives with manuals originally written in Japanese and then translated first to Chinese and then to English, but the Baofeng manual is particularly impenetrable.

I was simply stating an opinion on a subject that had been started. Again I’m agreeing with you not disagreeing. If a person is handicapped in some way that prevents them from easily using both upper/lower correctly it sure doesn’t bother me. But if one is capable they should be instructed. When I first started hamming I screwed up daily when on the air. There were those listening that were quick to set me straight. I took it as free classroom instructions and improved over time. I kinda see this medium in the same way. Maybe they simply don’t know any better and will never know any difference unless someone instruct them.

Why does it really matter? All caps, all lower case, misspelled, if o can read it, I don't complain. If I can't, I'll ask for a clarification. Many hams have physical disabilities and feel proud to be able to communicate by computer. Worrying about case type, fonts, etc.., are a concern they don't need to hear. Same goes for spelling. Besides I am sure most of us can figure out quickly if the writer is mad and shouting, or not.

Nice. Was that the one where you had to reseat the boards because they didn't use gold flashed connectors and they would oxidize? My first was an S100 bus that I built from scratch. Worked for about 4 seconds and nothing. First working was a Quest Super Elf. Used an 1802. Our Baofeng processors are probably more powerful. :)

37167. RE: [baofeng_uv5r] WIRES Repeaters

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-11-28 18:39:14 UTC
From: Michael D Earls
Topic: 37167 Message: 37167

For starters,

http://www.repeaterbook.com/repeaters/FeatureSearch.php?state_id=48
<http://www.repeaterbook.com/repeaters/FeatureSearch.php?state_id=48&type=WI
RES%20II#sthash.EWOVt5jJ.dpbs> &type=WIRES%20II#sthash.EWOVt5jJ.dpbs

Repeaterbook actually has a defined search for WIRES yielding no results for
Texas.
A search for WIRES in CA only returned four.

http://www.artscipub.com/repeaters/search/index.asp?state=Texas

http://www.kb5wck.com/Texas_Repeaters.php

Using http://www.rfprojector.com/repeater/index.php

#1486 - no repeaters found for callsign
#1350 - no repeaters found for callsign
#1346 - no repeaters found for callsign
#1656 - no repeaters found for callsign
#1550 - no repeaters found for callsign
#1485 - no repeaters found for callsign
#1244 - no repeaters found for callsign
#1127 - one repeater shown in Fort Worth, closed, limited access, no mention
of WIRES
http://www.n4mse.com/uhf.htm

#1242 - one repeater shown in McAllen, no mention of WIRES
Only mention of WIRES is over ten years ago.
9-15-03
Wires node 1242 <http://www.qsl.net/earth/w1242.htm> on Line! (a map will
be on line soon)
The much talked about Yaesu WIRES-II system went online today using the
147.320+ Pl=82.5 repeater.

#1582 - no repeaters found for callsign
#1547 - no repeaters found for callsign
#1548 - no repeaters found for callsign
#1248 - no repeaters found for callsign
#1289 - one repeater shown in Katy, no mention of WIRES
#1600 - no repeaters found for callsign
#1614 - no repeaters found for callsign
#1654 - no repeaters found for callsign
#1555 - no repeaters found for callsign
#1130 - no repeaters found for callsign
#1185 - no repeaters found for callsign
#1624 - no repeaters found for callsign

#1728 - no repeaters found for callsign
#1418 - no repeaters found for callsign
#1675 - no repeaters found for callsign
#1378 - no repeaters found for callsign
#1509 - no repeaters found for callsign
#1182 - no repeaters found for callsign

Found this list dated 2010:

http://www.waterfunrental.com/K0SWI/IRADIO/WIRES/WIRES%20II%20NODE%20UPDATE.
htm

#1360D WA5KXX Allen TX no repeaters found for
callsign
#1350D WA5BGO Austin TX - see above
#1346D KD5YOQ Burkburnett TX see above
#1244D N5ADL Corpus Christie TX see
above
#1127D N4MSE Dallas Area TX - see above
#1242D N5SIM Deep South TX see above
#1248D AK5Z Harlingen TX #0115D - see above
#1289D W5EMR Houston TX see above
#1130D N5UIG Plano TX - see above
#1185D K5TCP Plano TX - see above
#1441D WB5DTW San Antonio TX no repeaters found for
callsign
#1418D KJ5SK San Marcos TX see above
#1378D WB5TTY Temple TX see above

So, out of your list and mine, only three repeaters are still listed, with
no confirmation that WIRES is still supported.

Does this constitute looking hard enough?

Over 25 years ago, the Motorola Radio Club I belonged to had a
demonstration of radio fingerprinting. Half a dozen at the meeting had
their HT with them and we were able to see the difference in the signal.
When you unkey the radio it gives something like a tail (tale?). Almost
like a hiccup at the end. We had two radios same make and model different
blip at end.

Has anyone had problems getting either the stock (factory) software or CHIRP to communicate with the BF-8+? I have just taken delivery of two of these radios, and can't seem to get either software to read either radio.

I've verified that the dongle is installed with the correct driver, but still no joy.

Any ideas?

37173. RE: [baofeng_uv5r] RE: Freq's for non Hamm users?

Topic: 36895 Message: 37173

I once worked a project where I could identify a piece of equipment by serial # based on the same idea.

Trying to ID the electronic signature (frequency info) was much more difficult but the mechanical switch was quite identifiable and varied a lot from one "identical" item to another. We we're using that info to identify microphones so the same idea applies here.

wrote:

The simple fact exists, it was available some years back, know of one instance where it was installed for a while and then was very quietly removed and forgotten. Just the memory of its having been there was then used as a deterrent to the foolish acts of some people. Kind 'a like the Wouf Hong.

The one big block to its use was that you had to record each radio's "fingerprint" while the person was using it, just talk to friends... with a call sign.

That required that someone would have to be monitoring the repeater 24/7/365 in order to build up a usable database. Or, have a long term tape recorder running in synch with the data gatherer so you could catch call signs or recognize voices. Remember, this was like fifteen years ago. Terabit drives were only used by the NSA.

You might find some folks... the usual ones who had "nothing to hide", who would actually allow you to fingerprint their equipment. But, would you figure that the bad guy would go along with that request? And of course, there are some of us who would find such a request to be defamatory and intrusive.

The recorder would tap into the discriminator's (the circuit that recovers audio data from the incoming FM signal) dc coupled output, and record everything, even down to how far off frequency the incoming signal was. How? Easy, discriminators provide a dc offset either plus or minus depending upon the resting frequency of the received signal... There were some older (ancient) rigs who had a tuning meter that looked at that value as an aid to setting your receiver exactly on channel.

But, the crystal drift of all the repeater's receive oscillators (both first AND second conversion) had to be zero, or that data would be compromised. You could still record the time variable data, e.g.. how long it took for the transmitter's signal to settle down and how stable it was, any background hums, the exact amplitude of the PL tone and any distortion in it. I'm probably missing a few other bits, but you get the idea.

With today's digital storage capabilities, it might actually be more friendly, but back then, it was a chore to use.

Mr. Kelly was no longer an "avid amateur radio operator" because the FCC had already cancelled his license in September.

It worked for me on my Linux Mint 13 computer. I'm not a Linux guru but
from the error it looks like you should have uninstalled the 0.1.12-1
version first.

Are you referring to a Bf-F8+ or the UV-82?

I have read every BF-F8, BF-F8+ and BF-F9 I have received using Chirp without fail and programmed more than a dozen of them with the same software. The at=re the same circuit board as the UV-5R and the ones I have read and programmed are also Firmware 297 or 311 versions...

Has anyone had problems getting either the stock (factory) software or CHIRP to communicate with the BF-8+? I have just taken delivery of two of these radios, and can't seem to get either software to read either radio.

I've verified that the dongle is installed with the correct driver, but still no joy.

Any ideas?

I have used both the CHIRP and VIP software on the BF-82X 144/220 radio and they both work fine for me on a Win7 system and a Win XP system. Perhaps your USB cable?

A very simple Linux shell script returns the following results from repeaterbook.com:

Alaska WIRES II Amateur Radio Repeaters 1 repeater found in Alaska.
Arizona WIRES II Amateur Radio Repeaters 4 repeaters found in Arizona.
California WIRES II Amateur Radio Repeaters 4 repeaters found in California.
Connecticut WIRES II Amateur Radio Repeaters 1 repeater found in Connecticut.
Florida WIRES II Amateur Radio Repeaters 2 repeaters found in Florida.
Hawaii WIRES II Amateur Radio Repeaters 1 repeater found in Hawaii.
Illinois WIRES II Amateur Radio Repeaters 1 repeater found in Illinois.
Michigan WIRES II Amateur Radio Repeaters 1 repeater found in Michigan.
Minnesota WIRES II Amateur Radio Repeaters 1 repeater found in Minnesota.
Wisconsin WIRES II Amateur Radio Repeaters 1 repeater found in Wisconsin.

On 11/28/2013 10:39 AM, Michael D Earls wrote:

For starters,

http://www.repeaterbook.com/repeaters/FeatureSearch.php?state_id=48&type=WIRES%20II#sthash

#1624 - no repeaters found for callsign
#1728 - no repeaters found for callsign
#1418 - no repeaters found for callsign
#1675 - no repeaters found for callsign
#1378 - no repeaters found for callsign
#1509 - no repeaters found for callsign
#1182 - no repeaters found for callsign

Found this list dated 2010:

http://www.waterfunrental.com/K0SWI/IRADIO/WIRES/WIRES%20II%20NODE%20UPDATE.htm

#1360D WA5KXX Allen TX no repeaters found for callsign
#1350D WA5BGO Austin TX - see above
#1346D KD5YOQ Burkburnett TX see above
#1244D N5ADL Corpus Christie TX see above
#1127D N4MSE Dallas Area TX - see above
#1242D N5SIM Deep South TX see above
#1248D AK5Z Harlingen TX #0115D – see above
#1289D W5EMR Houston TX see above
#1130D N5UIG Plano TX - see above
#1185D K5TCP Plano TX - see above
#1441D WB5DTW San Antonio TX no repeaters found for callsign
#1418D KJ5SK San Marcos TX see above
#1378D WB5TTY Temple TX see above

So, out of your list and mine, only three repeaters are still listed, with no confirmation that WIRES is still supported.

Does this constitute looking hard enough?

Has anyone had problems getting either the stock (factory) software or CHIRP to communicate with the BF-8+? I have just taken delivery of two of these radios, and can't seem to get either software to read either radio.

I've verified that the dongle is installed with the correct driver, but still no joy.

Any ideas?

"arriving at conclusions"? Why is a simple question about another ham's FCC experience perceived as a conclusion? The research was done prior to asking.

Gary,

As you stated, what can you expect from a government software program? Sometimes when the ULS software is given multiple callsign lookups in a row, sometimes the system can't handle it correctly and displays that error message. The only way to ensure that each attempted callsign lookup is handled as a unique request is to click new search (not refine search). When a person bounces around within the ULS system (sometimes searching by name, other times by callsign), the ULS system can't handle that either and displays that same misleading error message.

New to group and 1st post

I have recently purchased myself a <http://groups.yahoo.com/neo/groups/baofeng_uv5r/conversations/messages> baofeng uv5ra, so far I like what I have and have recommended it to a couple of ham friends.

I ordered a bigger battery BL-5L, as luck would have it.it won't fit..is this a common problem or have I ordered the wrong product.

I have had a close look at the battery and think I could 'shave" the offending plastic off, is this common and advisable??

Tom,

Yes, when you order a non-standard UV-5R model radio, many (most?) of the one-off units like the UV-5RA don't accept the extended battery without modification. I have some friends that don't mind having to modify parts on a new product to get it to work, and many that do mind, it's all in your way of looking at it.

Some on this forum claim to have found extended batteries that do fit these one-off models, but I've yet to find that source that states their extended batteries will fit without modification. If you decide to keep both the radio and the battery, there are several You-Tube sites that show the battery modification required, just be advised that no seller is going to take back a modified battery "if" you decide later you don't like your modification.

Michael,

Do you really have VIP software for the BF-82X (UV-82X)? I've noticed that some use VIP to refer to any factory software for the Baofeng UV-5R/UV-82 radios. In reality there are two versions, CPS (customer programming software) and VIP (which is harder to come by until it gets loose on the internet). The VIP software has an "Other" menu that allows the user to change the band limits and edit the power-on message. The CPS software does not have this menu. I have never run across VIP software for this model, so if what you have is really the VIP version, I would like to get a copy. Where did you get it from?

Thanks in advance,
Jim KC9HI

What version of Ham Radio Deluxe works with these Baofeng UV5R?..
From what I saw with my version 5.24 I think it was- This radio is not even listed-
Also I read in here about problems with drivers.
Do I need to search for something additional for the HRD to list my radio on startup?
Thanks in advance !

I’ve got the latest version of HDR 6.1.4.189 and Baofeng is not listed at all.

I think you’ll find HRD is oriented towards HF radios much more so then VHF/UHF

One major reason being is that you can’t control the UV-5R frequencies and such remotely.

I've never heard of anyone using HRD with the UV-5R. Isn't HRD remote control software? The UV-5R can't be remotely controlled. It can only be programmed using the factory CPS and VIP software, CHIRP software, RT Systems software and Baoclone software.

That link appears to view the database for "pending applications"....
so, I'd say there is nothing pending for that callsign.

When Igot my ticket, I looked myself up under my name and couldn't find it. I then looked up all hams in my city and whadda ya know, there I was.

Of course one can't transmit until the license is stated on the website, and it raises the question: before the web, were there published lists of callsigns, and how often were they published and mailed, how large were they, etc.? Certainly not as much of a letter-carrier's nightmare as the Sear's Catalog every season ... and were there recent problems during the government shutdown?

Yup. And, the interval from passing the test to receiving the license in the mail was often 2 months or so. And there was, at least for new hams, the anticipation of what one's callsign would be.

Paul,

If no one has this, you can go here and do it yourself:

http://www.repeaterbook.com/repeaters/prox.php#sthash.GYl0paBg.dpbs

Export as a CSV file to your computer.

Modify as you like in Excel.

Upload using CHIRP in the usual way.

Once you do this, you will see how easy it is.

I know that radio fingerprinting was used on a couple of repeaters in Southern California, but set up the opposite way around. Rather than bothering to fingerprint every radio that would be allowed to use the repeater, they would just fingerprint the radio(s) of recurring abusers and configure the repeater to block any signal that matched.

Back when the FCC actually enforced its regulations, most repeaters had control operators monitoring most of the time (it was a requirement for having an autopatch running). It wasn't hard for a control operator to trigger the recording when a regular offender came on the air.

Have you tried actually reading the User Guide and other information available to you on the Miklor website????

There really is a reason why every single message in this group has the address for the Miklor website automatically included. It is considerably less than once a month we see someone ask a question that isn't already answered on that website.

There are numerous common problems getting ANY computer to communicate with any of the BaoFeng radios – but those problems each have simple solutions that are explained in detail on the Miklor website.

You say that you "verified that the dongle is installed with the correct driver" but you never mention what driver that is. If you are running any version of Windows, the odds are about 99% that you do not have the correct driver installed unless you have followed the steps listed on the Miklor website in detail.

Gary, You REALLY need to learn how to work ULS

An ULS search on W5TXD returns two results. The first is the previous holder of the call, which expired a little over 5 years ago (making it available again), and the second is the current vanity call assigned to Kurt.

> so far I like what I have and have recommended it
> to a couple of ham friends.

They are excellent little radios, for the price, and under the right conditions.

> I ordered a bigger battery BL-5L, as luck would have
> it…it won’t fit….is this a common problem or have I
> ordered the wrong product.

Yes, it is a common problem, and yes, you ordered the wrong product.

> I have had a close look at the battery and think I
> could ‘shave” the offending plastic off, is this
> common and advisable??

The situation is that the UV-5RA is internally identical to the UV-5R but has a slightly different case. In fact ALL the UV-5anything radios are all identical internally but some have slightly different case styles. (The only exceptions are that there are a couple of versions of the UV-5R that are factory build for VHF/VHF operation covering the amateur 2M band and the 1.25M (220 MHz) bands. These radios have exactly the same circuit board but have a different filter installed for the 1.25M band instead of the UHF filter)

The way that the extended capacity battery attaches to the radio uses the latch at the top AND fits together with the feet on the bottom of the radio. Because the UV-5RA uses a different case style, the battery meant for the UV-5R will not fit properly. (The AA battery case also is the same design and has the same problem.)

It is POSSIBLE to shave the plastic to make the UV-5R battery fit onto a UV-5RA - depending on how skilled you are at modifying the battery and/or the radio you may be able to get a fairly good fit, but it will never be perfect.

Until recently, this was the only way to fit an extended battery to the UV-5R; but in the past few months, batteries made for the UV-5RA have become available from a number of sellers. The seller who sold you the UV-5RA, ought to have the correct battery available.

I would suggest that you check with the dealer who sold you the BL-5L battery to see if he has the model to fit the UV-5RA available and to see if you can exchange the battery for the correct one. If you can't exchange it, then you might be able to find a UV-5R user in New Zealand to work out a deal, or you can modify the battery to fit.

To answer the question "were there published lists of callsigns" yes there was and still is an ARRL publication called, of all things, "The Radio Amatuers Call Book". My oldest copy is a 1957 issue and cost $4.50. A new one will set you back $49.95. It's sure lot cheaper to go the QRZ..COM web site though.

If you are programming a TX CTCSS (PL) tone for a repeater, then you've probably also programmed a RX CTCSS tone as well. If the repeater does not transmit a CTCSS tone (many don't) or the tone it is transmitting is different than the tone you programmed, then you will never hear anything.

Unless you understand how CTCSS work and are positive that the station that you are listening to will be transmitting the tone you program, you should never program a RX CTCSS tone. Having no RX CTCSS tone always works. Then as you understand CTCSS, you can add an RX CTCSS tone if you decide the need is warranted.

How are you programming your radio (keypad, Baofeng or CHIRP)?

TOM,

HERE IS THE SOLUTION I FOUND FOR THE AA BATTERY PACKS PURCHASED FROM
3 OLD CROWS.

THE BATTERY PACK WOULD FIT WITH FORCE BUT MOST DIFFICULT TO REMOVE.

AT THE BOTTOM OF THE THINNEST PART OF THE PACK ARE TWO RECTANGULAR
RETAINING HOLES. THE RADIO SETS IN THESE AND IS PUSHED UP TO LOCK.
AFTER TRYING SEVERAL FIXES FOUND HERE AND ELSEWHERE AND NO LUCK.
I GOT A VERY THIN DIAMOND BIT AND PROCEEDED TO TAKE A VERY SMALL
AMOUNT OFF THE INSIDE EDGE ONLY. THE PACKS SLID INTO PLACE WITH EASE
AND REMOVED WITHOUT PROBLEM. I DID THIS TO THE TWO OTHER PACKS WITH
THE SAME RESULTS.

I WOULD SUBMIT PICTURES BUT CAN'T GET THEM THE WAY I WANT FOR CLAIRTY.

I HAD PURCHASE AAA PACKS FROM A DIFFERENT SOURCE AND HAVE NOT HAD
A PROBLEM WITH THEM FITTING THE UV 5R. DIFFERENT CASES HAVE DIFFERENT
PROBLEMS.

IF YOU USE THE BATTERY PACKS REMEMBER THAT 6 FRESH BATTS WILL
PRODUCE ABOUT 9.6 V CAUSING THE UV 5R TO POWER UP AND THEN SHUT
DOWN. USUALLY, ANYTHING UNDER ABOUT 8.2/8.4 V WILL WORK DOWN TO
AROUND 6/6.5 V.

Subject: [baofeng_uv5r] baofeng- uv5ra battery

New to group and 1st post

I have recently purchased myself a baofeng uv5ra, so far I like what I have and have recommended it to a couple of ham friends.

I ordered a bigger battery BL-5L, as luck would have it.it won't fit..is this a common problem or have I ordered the wrong product.

I have had a close look at the battery and think I could 'shave" the offending plastic off, is this common and advisable??

Tom

37239. RE: [baofeng_uv5r] Interference on 2m and marine channels dont get it on Yaesu

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: Michael D Earls
Topic: 37237 Message: 37239

Oddly, I experienced just the opposite. I have a Yaesu FT-8800R using an indoor antenna. For months, I was unable to use the 2m due to RFI from my cable modem and router.

However, reception on the UV-5R was unaffected by the RFI unless I connected it to the indoor antenna. With the NA-771 whip, 2m was fine.

I greatly reduced the problem on the Yaesu by relocating the indoor antenna.

Subject: [baofeng_uv5r] Interference on 2m and marine channels dont get it on Yaesu

I have been getting interference on my Baofeng 5RC from 130mhz to 180mhz it is localised but I cant find it a friend lent me his 5B it is exactly the same. I borrowed a Yaesu FT2800M no interference anywhere on the same freq. Is the Baofeng overly sensitive or can anyone shed any light on the anomaly

The first guess would be that you are probably programming a receive PL tone – and the simple answer to that would be DON’T

There is NEVER any case where you need to program any Receive tone or code. (Before the couple of other people who insist on replying get on their high horse, yes, there can be situations where is may be useful to program a receive tone, but there is NEVER ANY CASE where a receive tone is NECESSARY, and no one who needs to ask about tones should ever try programming any receive tone)

From: ranger2995@...

Well I can get the radio to transmit with the proper PL but it wont receive> What am I doing wrong. I think I can program it manually if I can get the RX issue fixed

ANY receiver can be overwhelmed by a signal that is close to the receive frequency.

Generally speaking the BaoFeng UV-5R family of radios are well known for being among the worst in terms of having the radio front end totally overwhelmed by just about any strong signal anywhere in the same band. This is a simple fact of the design of these radios with essentially no tuned circuit in the front end and only a filter that is designed to pass the entire operating band.

In Mike's case, the Yaesu was seeing a much stronger interfering signal from the indoor antenna compared to what the BaoFeng was seeing from the rubber duck. Swapping the antennas would undoubtedly have swapped the problem between the two radios.

Meanwhile in Simon's case obviously the two BaoFeng radios have identical circuitry and showed identical results under identical conditions -- the Yaesu mobile was completely different and didn't show the same interference. If the interference is continuous, it is probably some device in the immediate area such as a computer, router, modem, or even some appliance. Intermittent interference is more likely to be some radio transmitter nearby. Typically the most common source of intermittent interference in an urban area would be a nearby paging service transmitter, but actually any strong signal within a couple miles of the receiver will usually break the squelch of these HTs. I wouldn't be surprised if Simon would find a paging service operating somewhere in or near Great Yarmouth -- perhaps one of the local hospitals has its own paging transmitter, or some other sort of commercial transmitter such as a taxi dispatch.

The frequencies are indeed shared by all licensed amateurs but the machines (repeaters) are privately owned or club owned and can be limited access or closed. In the 80's I belonged to a club that owned the repeater which was free to club members (part of the dues went for repeater maintenance), but closed to non-paying hams.

The frequencies could be used by anyone but it ;just wouldn't key the repeater without the code tone which was "secret".

Have had 2 of these neat little radios several months now
Chirp and 2 working cables
1 extended battery that fits one radio but not the other one
1 Enhanced dual band antenna
Now just have to get the battery replacement for car charging

Thanks to the group and website has been easy to setup chirp on Linux and windows
Just had to set as root to access USB ports on Linux mint 15.

All anybody has to do is to read Part 97 and see that repeater owners can pick and choose who is allowed to operate their repeaters. It is the same as you being able to say who can and cannot use your base station or mobile equipment.

Shuler,

The battery eliminator for the car does just that, it replaces the battery with a battery shaped shell that regulates the 12-14V from the car to the proper voltage for the radios. It doesn't charge anything.

If you want to charge the battery in the car, you will need to purchase a 12-24V in to 10v out adapter similar to the link below and use it with the existing charging cradle.

http://threeoldcrows.com/shop/magento/ham-radio-equipment/accessories/12-24-volt-car-charger-cable-for-bapofeng-radios-10v-500ma-output.html

What you want to do in Linux Mint is add your user to the "dialout" group.

Jim KC9HI

p.s. I just noticed today that Linux Mint 16 was just released.

Just cause you have an Amateur License doesn't mean you have knowledge
of Amateur Radio.
Anyone can memorize the question pool and pass.

This will be the last time I respond to you, TROLL!!

Dale,

What you call "military date" is how other many other countries actually write the date. :-) Shows just how odd Americans are, including clinging to outdated stuff (not necessarily radio related) when the rest of the world has moved on to something more efficient.

Barry, don't be a bigger douchebag than what you already are. The spelling all depends on which side of the pond you are on.

Classic example there. Your spell chequer did not pick up your
misspelling of favourite.

Ah but Barry has no need to read Part 97 as he is from the UK and US laws don't apply to him. Don't feed the trolls

All anybody has to do is to read Part 97 and see that repeater owners can pick and choose who is allowed to operate their repeaters. It is the same as you being able to say who can and cannot use your base station or mobile equipment.

The frequencies are indeed shared by all licensed amateurs but the machines (repeaters) are privately owned or club owned and can be limited access or closed. In the 80's I belonged to a club that owned the repeater which was free to club members (part of the dues went for repeater maintenance), but closed to non-paying hams.

The frequencies could be used by anyone but it ;just wouldn't key the repeater without the code tone which was "secret".

If its closed it has no access.
Amateur radio frequencies are shared by all licensed amateurs.

No such thing as a limited access amateur repeater.
